IMPORTANT INSTRUCTIONS TO READERS:

This report is based on data collected from 25,321 households from Andhra Pradesh during 2007-08. From these households, 21,730 ever-married women aged 15-49 years and 3,945 unmarried women aged 15-24 years were interviewed. Most of the tables and analysis presented in the report is based on ever-married women aged 15-49 years. However, for the purpose of comparison with DLHS-2 (2002-04) and the Fact Sheet of DLHS-3, we also provided some indicators based on currently married women aged 15-44 years in selected tables. We request the readers to keep this distinction in mind while using and comparing the DLHS-3 indicators with other surveys.

For more information, visit DLHS website: <http://www.rchiips.org>

Preface and Acknowledgements

The District Level Household and Facility Survey (DLHS-3) is a nationwide survey covering 601 districts from 34 states and union territories of India. This is the third round of the district level household survey which was conducted during December 2007 to December 2008. The survey was funded by the Union Ministry of Health and Family Welfare, United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

We are very grateful to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for the DLHS-3 Project and providing an opportunity to work closely with the health and programme officials. In particular, we would like to thank Ms. K. Sujatha Rao, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for her advice, suggestions and support. We also thank Shri Naresh Dayal, former Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for the advice and valuable support extended to the project. Our special thanks to Smt. Madhu Bala, the Additional Director General, Dr. Rattan Chand, the Chief Director and Shri. Rajesh Bhatia, the Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their active involvement and suggestions. We are also thankful to Dr. V.K. Malhotra and Shri S.K. Das, former Additional Director Generals, Shri Partha Chattopadhyay, former Chief Director, Shri K. D. Maiti, former Director and Ms. Rashmi Verma, former Deputy Director-Statistics Division, MoHFW, Government of India for the co-operation and support at various stages of this project.

We are grateful to late Dr. P. N. Mari Bhat, former Director, IIPS and Prof. S. Lahiri, for their keen interest and guidance in the initial stages of the project. We acknowledge the contributions of Population Research Centre, Visakhapatnam; regional agency for the field implementation of DLHS-3 in Andhra Pradesh state. The monitoring of the field survey was done independently by Population Research Centre, Bangalore under the guidance of National Institute of Health and Family Welfare, New Delhi.

Our thanks to the members of Technical Advisory Committee (TAC) of DLHS-3 and especially to its Chairman, Dr. P. M. Kulkarni, Professor, Jawaharlal Nehru University, New Delhi. We also thank Dr. N.K. Singh for guiding the software development and CSPro training for the project staff. We gratefully acknowledge the immense contributions of DLHS-3 project team at IIPS in developing survey instruments, training field staff, monitoring field work, data processing, preparation of district and state level fact sheets, and drafting the reports.

Finally, special thanks to all respondents who spared their valuable time and cooperated with us by providing the required information.

DLHS-3 Coordinators
International Institute for Population Sciences

BACKGROUND AND OBJECTIVES OF THE SURVEY

The National Rural Health Mission (2005-2012) was launched by the Government of India (GoI) in 2005-06 to provide effective health care to rural population in the country with special focus on states which have poor health outcomes and inadequate public health infrastructure and manpower. The primary focus of the mission is to improve access of rural people, especially women and children, to equitable and affordable primary health care. The main goal of NRHM is to reduce infant mortality rate (IMR) and maternal mortality ratio (MMR) by promoting newborn care, immunization, antenatal care, institutional delivery and post-partum care.

The National Rural Health Mission (NRHM) foundation is built on community involvement in drawing a village health plan under the auspices of village Health & Sanitation Committee (VHSC), making rural primary health care services accountable to the community and giving authority to the District Health Mission for implementation of inter-sectoral District Health Plan including drinking water, sanitation, hygiene and nutrition. The interface between the community and the public health system at the village level is entrusted to a female Accredited Social Health Activist (ASHA), a health volunteer receiving performance based compensation for promotion of universal immunization, referral and escort services for reproductive & child health (RCH), construction of household toilets, and other health care delivery programmes. To promote institutional delivery, cash incentive programme under Janani Suraksha Yojana (JSY) is made an integral component of NRHM.

The third round of the District Level Household and Facility Survey (DLHS-3) carried out during 2007-08 was designed to collect data at district level on various aspects of health care utilization for Reproductive & Child Health (RCH), accessibility of health facilities, assess the effectiveness of ASHA and JSY in promoting RCH care, to assess health facility capacity and preparedness in terms of infrastructure. The integration of facility survey with the household survey was done with a view to link the RCH care outcomes to health facility accessibility, availability of medical & paramedical manpower and other village infrastructures. The broad objective of DLHS-3 is to provide RCH outcome indicators at the district level in order to monitor and provide corrective measures to the NRHM. The other important objective is to assess the contribution of decentralization of primary health care at the district level and below by way of involving village health committees under the Panchayats in the implementation of health care programmes.

The main focus and objectives of DLHS-3 is to provide RCH indicators covering the following aspects:

- Coverage of antenatal check up and immunization services
- Institutional/safe deliveries
- JSY beneficiaries
- Contraceptive prevalence rates
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTIs/STIs and HIV/AIDS
- Family life education among unmarried adolescent girls
- Health facility and infrastructure

The District Level Household and Facility Survey, 2007-08 (DLHS-3) is the third in the series of district level household surveys. The first one was conducted in 1998-99 followed by the second in 2002-04. For all the three DLHS, the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI) designated the International Institute for Population Sciences (IIPS), Mumbai, as the Nodal Agency responsible for the development of survey design, instruments, data entry and tabulation software, training, supervision of field work, analysis and report writing. The sources of funds for DLHS-3 are the MoHFW, GoI and United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

A Technical Advisory Committee (TAC) constituted by the MoHFW, GoI guided the designing, implementation, progress, tabulation, basis of selection of RCH indicators and consistency issues.

SURVEY DESIGN, SAMPLE SIZE AND DESIGN WEIGHT

A multi-stage stratified systematic sampling design was adopted for DLHS-3. In each district, 50 primary sampling units (PSUs) which were census villages in rural areas and census enumeration blocks (CEBs) in urban areas. In rural areas, villages were selected by probability proportional to size (PPS) systematic sampling and in the second stage households were selected by systematic sampling. For urban areas first wards were selected by PPS systematic sampling, in the second stage CEBs by PPS sampling and households in the third stage by systematic sampling. The Census of India, 2001 was the sampling frame for DLHS-3. All villages and urban wards in a district were stratified by household size into three strata of less than 50, 50-300 and 300+ households, percent of SC/ST population into two strata-below and above 20 percent and implicitly by three alternating order of female literacy. These variables used for stratification are from the 2001 Census. The number of households representing a district is either 1000 or 1200 or 1500 considering the levels of immunization, antenatal check up and institutional delivery as given by DLHS-2 plus 10 percent over sampling to cushion for non-response. The PSUs are allocated to rural and urban areas of each district proportionally to the actual rural-urban population ratio and within the rural-urban domains. The PSUs are further distributed proportionately to the different sub-strata of combinations of household size, percent of SC/ST population and levels of female literacy. To make a proper rural PSU, selected villages with less than 50 households were linked with another contiguous village and selection probability is adjusted accordingly. Selected villages with more than 300 households were further divided into two or more segments and one or more segments were selected so as to have standard size PSUs. The numbers of households drawn from PSUs of districts represented by 1000, 1200 and 1500 households are 22, 27 and 33 households respectively. All ever married women age 15-49 years and adolescent's age 15-24 years from the sampled households are the respondents for questions on RCH and family life education, while any adult household member is the respondent for household related questions in DLHS-3.

Sampling weight for household, ever married women and unmarried women were generated for each district. These design weights were used for computations of district level demographic and RCH indicators. The selection probabilities f_1^i , f_2^i and f_3^i at different stages of randomization pertaining to the i^{th} PSU of a district were the main inputs for generation of design weight. These selection probabilities are defined as follows:

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ rural PSU in a district}$$

$$= \frac{(n_r * H_i)}{H}$$

Where, n_r is the number of rural PSUs selected from a district, H_i refers to the number of household in the i^{th} PSU and $H = \sum H_i$, total number of rural households in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU}$$

(in case the i^{th} selected PSU is segmented)

$$= (\text{Number of } i \text{ households in the selected segment}) / (\text{number of households in the PSU})$$

The value of f_2^i is to be equal to one for un-segmented PSU.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= \frac{HS_i}{HL_i}$$

Where HL_i is the number of households listed in i^{th} PSU in a district and HS_i the number of households per PSU assigned for the i^{th} PSU is either 22 or 27 or 33 depending on whether a district is represented by 1000 or 1200 or 1500 households.

For urban PSUs, f_1^i is computed as the ratio of urban population of the selected PSU to the total urban population of the district.

The probability of selecting a household from the district works out as:

$$f^i = (f_1^i * f_2^i * f_3^i)$$

The non-normalized household weight for the i^{th} PSU of the district is, $w^i = \frac{1}{f^i * HR_i}$, where

HR_i is the household response rate of the i^{th} sampled PSU, assumed to be 10 % but actual response rates are used here. The normalized weight used in the generation of district indicators as

$$n_i^d = \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i, i=1, 2, 3, \dots, 50.$$

Where n_i is the number of households interviewed in the i^{th} PSU. The weight for women is computed in the similar manner after multiplication of expression for f^i by the corresponding response rate. State weights for households, women and husbands are further derived from the

district weights n_i^d for the i^{th} PSU in d^{th} district using external control so that sample results do not deviate from the corresponding information about the population.

Let, $n_s = \sum_i n_i^d$ and $N_{sc} = \sum_i N_i^d$, denote the number of households in the sample and census of a particular state, then state level households weights work out as:

$$n_i^s = n_i^d * \frac{\left(\frac{N_i^d}{N_{sc}} \right)}{\left(\frac{n_i^d}{n_s} \right)}, \text{ where } n_i^d \text{ represents household sample in } i^{\text{th}} \text{ district, } n_s \text{ is the total}$$

sample in the state. These households' weights are computed for rural-urban areas separately. Considering sample and census currently married women age between 15-49 years and married males above 15 years for specified state by districts and rural-urban residence, state level women weights are obtained for estimation of state level indicators.

IMPLEMENTATION AND QUALITY CONTROL

Actual field operation of DLHS-3 in different states and union territories were implemented by Regional Agencies (RA) selected by the MoHFW through a competitive bidding process and Population Research Centre, Visakhapatnam, was designated as regional agency (RA) for implementation of DLHS-3 in Andhra Pradesh. Data from the selected PSUs were collected by a team of 5 persons consisting of one Supervisor, one field Editor and three Female Investigators who are graduates at least. A minimum of two days visit to each sampled PSU is followed to ensure 100 percent coverage of selected households, ever married women and unmarried women. Independent team of Health Investigators, mostly paramedics were entrusted the work of carrying out the accompanying Facility Survey. A strict quality check protocol was put in place by the Nodal Agency by way of spot and back checks by an independent team. The Quality team comprised of two females and one male investigator and was headed by a Research Officer from the monitoring agency. One Research Officer from IIPS was stationed in each state throughout the period of the field work for supervising the survey operations.

SURVEY INSTRUMENTS

The main instrument for collection of data in DLHS-3 was a set of structured questionnaires, namely, household, ever married woman, unmarried woman and village questionnaires. Sub-Centre, Primary Health Centre (PHC), Community Health Centre (CHC) and District Hospital (DH) questionnaires were used to conduct the facility survey. All household level questionnaires were bilingual with questions in regional and English languages.

Household Questionnaire

The household questionnaire lists all usual residents in each sample household including visitors who had stayed the night before the interview. For individual household member information on age, sex, marital status, education and relationship to the head of the household were collected. Marriages and deaths of members of household were also recorded. Efforts were made to get information about maternal deaths. Information was also collected

on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, ownership of durable goods in the household, religion and caste of household head. The other information collected relates to awareness of government programmes.

Ever Married Women's Questionnaire

The respondents for the ever married women's questionnaire were ever married women age 15-49 years living in the sampled households. Details on age, age at marriage and place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Details about antenatal check-up, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use, sex preference of children and fertility intentions were recorded. For the recent births, immunizations status of children was collected either from the immunization card or by asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTIs/STIs and HIV/AIDS by source and treatment seeking behavior for RTIs/STIs.

Unmarried Women's Questionnaire

Information that was collected from unmarried women age 15-24 years (those under 18 years with consent from the parents) included knowledge of family life education, awareness about legal age at marriage, awareness about contraception, menstruation related problems, and knowledge of RTIs/STIs and HIV/AIDS by source of information.

Village Questionnaire

This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at village level. Functioning of village health committees and utilization of untied funds were additionally collected from the sampled villages of DLHS.

Facility Survey Questionnaires

In the facility survey, the information collected at the Sub-Centre level were availability of human resources, physical infrastructure, equipments and essential drugs and RCH service provided during the one month preceding the survey. Additional information collected at Primary Health Centre (PHC) level was availability of Lady Medical Officer, functional Labour Room, Operation Theatre, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that was collected for Community health centre (CHC) included status of in-position clinical, supporting and Para-medical staff, availability of specialists trained for NSV (Non-Scalpel Vasectomy), emergency obstetric, medically terminated pregnancy (MTP), new born care, treatment of RTIs/STIs, IMNCI, ECG etc. Physical infrastructures of CHC such as, water supply, electricity, communication, waste disposal facilities, Operation Theatre, Labour Room and availability of residential quarters for doctors were also collected in the facility survey. (The questionnaires are available at DLHS-3 website: www.rchiips.org).

HOUSEHOLD AND VILLAGE BACKGROUND

DLHS-3 Coverage and Response Rate

DLHS-3 surveyed a total of 25,321 households, 21,730 ever-married women and 3,945 unmarried women in Andhra Pradesh state (Table 1.1). The response rates are 90.5, 85.0 and 78.0 percent for households, ever-married and unmarried women respectively. The household response rate varies from 80.6 percent in Hyderabad to 96.5 percent in West Godavari. The response rate of ever-married women varied from 64.2 percent in Hyderabad to 90.5 percent in Nellore. The response rate for both household and ever-married women is the lowest in Hyderabad. In contrary, the response rate for unmarried women is the highest in Hyderabad (87.1 percent) and the lowest in Guntur (66.5 percent). As far as the demographic indicators of Andhra Pradesh (Table 1.2) are concerned, from 2001 census it can be noted that the overall sex ratio of 978 female per 1,000 males is above the national sex ratio of 933. In Nizamabad district, Srikakulam and Vizianagaram district of Andhra Pradesh, girls outnumber boys and in the remaining districts of Andhra Pradesh, the sex ratio is well above the national figure. The sex ratio in Hyderabad corresponds to the national sex ratio.

Village Characteristics

As regards the accessibility of health facilities to the sampled villages, 46.6 percent of villages have Sub-Centres within the village itself and as many as 45.9 percent of the villages are within 5 km. distance from a Sub-Centre. In Andhra Pradesh, 12.6 percent of the villages have a government dispensary within the village, 10.6 percent have Primary Health Centres (PHC) and 22.7 percent of the sampled villages have private clinics within the villages (Table 2.11). In Andhra Pradesh, 45.5 percent of villages have a governmental health facility. There is dearth of doctors, with only 10.8 percent of villages having doctors. It varies from absence of doctor in Karimnagar, Warangal, Srikakulam, Vizianagaram, West Godavari and Nellore to 37.5 percent in Nizamabad. Three-fourths of villages in Andhra Pradesh have an ASHA (67.0 percent) and four-fifths of villages have an *Anganwadi* worker (Table 2.12).

Household Characteristics

DLHS-3 surveyed a total of 1, 14,246 persons (Table 2.1) from 25,321 households (Table 2.8) in Andhra Pradesh covering all the twenty-three districts. About three-fifths of households (74.2 percent) are concentrated in rural areas and one-fourth of the households (25.8 percent) are in urban areas. In Andhra Pradesh, majority of the households belong to the Hindu religion (85.8 percent), 7.3 percent are Christians and 6.7 percent are Muslims (Table 2.7). Thirteen percent of household heads are females. Forty-seven percent of the household heads belong to other backward classes, 20.2 percent to others, 10.8 percent belong to scheduled tribe and 22.3 percent of household heads belong to scheduled castes (Table 2.7). The median age of household head is 45 years. The average household size in the state is 4.5 persons and there is no rural-urban difference in family size.

Most of the households (89.6 Percent) in Andhra Pradesh have electricity connection, 92 percent of households have access to improved source of drinking, with 23 percent of them having access to tap water for drinking into dwelling/yard/plot, 36 percent of households have provision for flush toilet, 26.3 percent of households use LPG for cooking, 41.0 percent live in *pucca* houses and thirty-eight percent have at least 3 rooms (Table 2.8). It is surprising to

note that 82.5 percent of households in Andhra Pradesh have BPL (below poverty line) cards and it varies from 45.5 percent in Hyderabad to 95.0 percent in Mahbubnagar (Table 2.9).

Household Wealth Index

Combining household amenities, assets and durable goods, a wealth index is computed at the national level and divided into quintiles. Households are categorized from the poorest to the richest groups corresponding to the lowest to the highest quintiles at the national level. Based on national cut-off points, in Andhra Pradesh, ten percent of households are in the lowest wealth quintile and 20 percent of households are in the highest wealth quintile. More than half of the households (57 percent) in urban areas are in the highest wealth quintile while in rural areas it is only 7 percent. Percent distribution of households by wealth quintile is as shown in Figure 1.

Age-Sex Composition

The overall sex ratio in Andhra Pradesh is 1,007 females per 1000 males (Table 2.1). The age-sex pyramid (Figure 2) depict a scenario of declining fertility with shrinking base of 28 percent of the total population below 15 years and indicates a gradually aging population with 5 percent of the population being above the age of 65 years. The remaining percent of the 66.8 population is in the 15-64 years age group. There is negligible rural-urban difference in having children below 15 years and having persons above 65 years.

The mean age at marriage of boys and girls in Andhra Pradesh are 23.8 years and 19.0 years respectively. In Andhra Pradesh 19.5 percent of boys and 28.6 percent of girls were married before attaining the minimum legal age for marriage (Table 2.3).

Literacy by Age and Sex

Thirty-nine percent of the population 7 years and above are non-literate; it is 48.4 percent for females and 29.9 percent for males (Table 2.4). The gender gap in literacy rate is narrow for the two broad age groups 7-9 years and 10-14 years. However for the age group 15-19 years, there is considerable gender gap in literacy rate by 10 percentage points (Table 2.4), also shown in Figure 3. The information on main reasons for dropping out of school was also collected in DLHS-3. For girls below 18 years as many as 30.1 percent stated that they were required for household work followed by 19.6 percent who cited disinterest in studies as the main reason for dropping out of school (Table 2.6). On the other hand, 29.1 percent of boys cited disinterest in studies as the main reason for dropping out of school followed by 20.9 percent who stated they were required for household work.

CHARACTERISTICS OF WOMEN AND FERTILITY

Thirty-six percent of ever married sampled women between 15-49 years got married at age 18 and above in both rural and urban areas (Table 3.1). There are more non-literate women in rural areas (61.8 percent) than in urban areas (27.8 percent). Non-literate husbands are about two times lesser compared to non-literate wives/women in both rural and urban areas. More than half of women in Andhra Pradesh is illiterate (53.2 percent) and 17.6 percent of women are educated at least for 10 years and the proportion of husbands with this many years of schooling is 29.2 percent. About half of the ever married women (49.2 percent) were married for 15 years or more and the distribution of ever married women in the categories of less than 5, 5-9 and 10-14 years marital duration are almost uniform, with at least 16 percent in each category.

In Andhra Pradesh, 7.6 and 13.7 percent of women belong to households in the lowest and second lowest wealth quintiles. The corresponding proportions of women belonging to these wealth quintile categories in rural areas are respectively 9.9 and 17.6 percent while in urban areas these are 0.7 and 2.1 percent respectively. Twenty-one percent of women belong to the highest wealth quintile, with only 8.0 percent in rural area and 58.2 percent in urban area.

Mean Children Ever Born by Districts

Mean children ever born (CEB) to ever married women between 15-49 years is found to be 2.3 with marginal differential by residence, while it is 2.7 for non-literate and 1.6 for women with at least 10 years of education (Table 3.5). The completed fertility measured in terms of average children ever born to ever married women between 40-49 years is 3.3.

The mean children ever born to ever married women by district is shown in Figure 4 and it varies from 2.6 children in Adilabad and Mahbubnagar districts to 2.1 children in Nellore and Nizamabad districts, while the state average is 2.3 children.

Out of the births to ever married women during the three year period preceding the survey, 18.2 percent were of third or higher order births and the corresponding figures were 26.3 and

21.9 percent respectively for non-literate and for the ever-married women with less than 5 years of schooling (Table 3.3). The births of third and higher order were more among the ever married women who are non-literate (26.3 percent), belonging to lowest wealth index (31.2 percent), those belonging to scheduled tribes (32.2 percent), compared to ever-married women educated at least up to 10 years (8.4 percent), those belonging to highest wealth index (11.6 percent), and those belonging to other castes (13.2 percent). Births of third and higher order are highest in Adilabad district (33.1 percent) and lowest in Guntur district (5.6 percent) (Table 3.4).

In Andhra Pradesh, most of the outcomes (94 percent) of pregnancies which occurred during the three years period preceding the survey to currently married women between 15-49 years are found to be live births. Only 4 percent of the pregnancies in the three years period preceding the survey resulted in spontaneous abortion and varies from 1.3 percent in Adilabad to 7.3 percent in Vizianagaram district (Table 3.7).

Fertility Intention and Preferences of Currently Married Women

Fertility preferences of currently married women in terms of desire for additional child and timing to have the desired additional child by number of living children are given in Table 3.7. Among those with no living children, about two-third of women (64.5 percent) want a child soon within the next two years and 16 percent want a child 2 or more years later. Among the currently married women with one living child, the proportion wanting an additional child soon within 2 years and after 2 years is 33 and 20 percent respectively. Most of the currently married women with two or more living children are either sterilized or want no more children.

Figure 5 depicts the fertility preference of all currently married women regardless of number of living children. Eight percent of currently married women want no more children, 15 percent want a child soon, 1 percent is undecided and 66 percent have undergone sterilization.

Among the currently married women with no living children but want a child, 85.7 percent reported that sex of the child does not matter, 4.3 percent say it is up to god while 7 and 3 percent want a boy and a girl respectively. With increasing number of living children, longing for an additional boy child becomes more and more magnified from 27.8 percent among currently married women with one child to 83.1 percent among currently married women with four or more living children (Table 3.6).

MATERNAL HEALTH CARE

Maternal health care package of antenatal care (ANC) is the main programme of NRHM to strengthen RCH care. ANC provided by a doctor, an ANM or other health professional comprises of physical checks, checking position and growth of fetus and giving Tetanus Toxoid injection (TT) at periodic intervals during the time of pregnancy. At least three check-ups are expected to complete the course of ANC to safeguard women from pregnancy related complications. Institutional delivery and post-natal care in a health facility is promoted in NRHM through the Janani Suraksha Yojana (JSY) to prevent maternal deaths.

Any ANC by Selected Background Characteristics

In Andhra Pradesh 96 percent of the women who had their last birth during the three year period preceding the survey, had received at least one antenatal care (ANC) service. Majority of women (63.6 percent) had received the service from a private health facility and little over two-fifth of women (43.9 percent) had received the ANC service from a government health facility (Table 4.1).

Any ANC coverage by selected background characteristics are diagrammatically depicted in Figure 6. In Andhra Pradesh, ANC coverage is reasonably good with more than 90 percent of women receiving any ANC irrespective of socio-economic background. A distinctive feature is that any ANC increases sharply with education and wealth index. Any ANC is 92 percent among non-literate as against 100.0 percent among women educated for 10 or more years and 79.0 percent among lowest wealth index as against 99.6 percent among women in highest

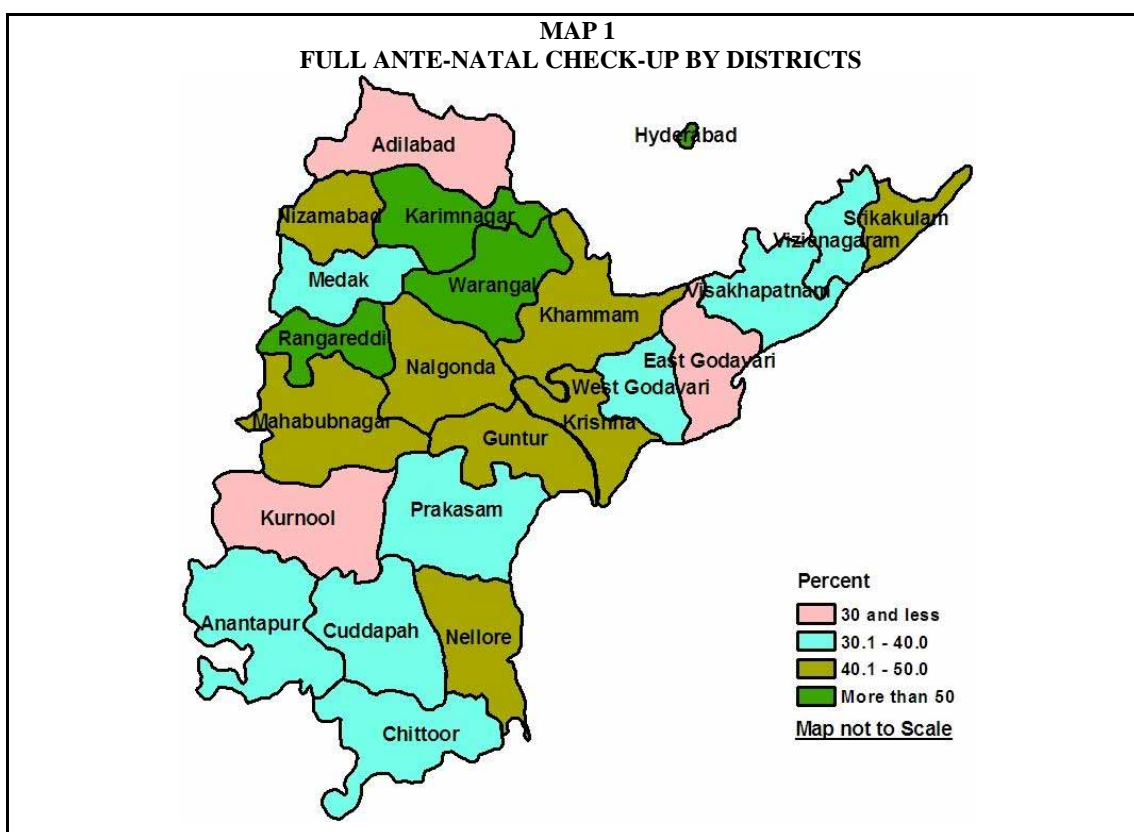

wealth index. There is only a marginal rural-urban gap of 3.8 percentage points in availing any ANC, with 98.8 percent among urban residents and 95.0 percent among rural residents.

The coverage of any ANC is highest in Hyderabad (100.0 percent), near universal coverage in Krishna, Nalgonda and Warangal (99.5 to 99.8 percent) and lowest in Adilabad district (88.3 percent). Majority of women in Chittoor district in the state are availing ANC from a government health facility (72.1 percent) while in Karimnagar district women are availing ANC from a private health facility (87.1 percent) (Table 4.2).

The proportion of women who received at least three ANC is 89.4 percent (Table 4.5A) and 67.3 percent of women had received first ANC in the first trimester of the pregnancy. Ninety-two percent women had received at least one TT injection whereas 41 percent of the women received full ANC in Andhra Pradesh (Table 4.5B). The proportions of women who consumed 100 IFA tablets/syrup and received at least one TT injection are 45.7 percent and 92.4 percent respectively (Table 4.6).

The utilization of antenatal care services differ by districts. In Andhra Pradesh, the proportion of women who received full ANC is lowest in Adilabad district (22.7 percent) and is highest in Karimnagar (56.1 percent) (Table 4.6). Hyderabad ranks highest in the percentage of women with antenatal check-up in the first trimester of pregnancy (86.2 percent). Three or more antenatal care visits is the highest in Krishna district (98.3 percent) and lowest in Visakhapatnam district (76.4 percent). Almost all women in Hyderabad had at least one tetanus toxoid injection, while women in Karimnagar district ranks highest in percentage of women who had 100+IFA tablets/syrup (57.5 percent) and East Godavari (30.2 percent) ranks lowest in the percentage of women who had 100+IFA tablets/syrup. Districtwise variation in coverage of full ANC is shown in the Map 1.

Even when women receive ANC, all recommended components of ANC to monitor high risk pregnancy, are not availed by women during pregnancy. Among women receiving ANC, 87.0 percent had an abdominal examination, 91.3 percent had their weight measured, and 86.2 percent had their blood pressure checked. Blood and urine test were conducted for 89.7 and 89.6 percent of women respectively (Table 4.3).

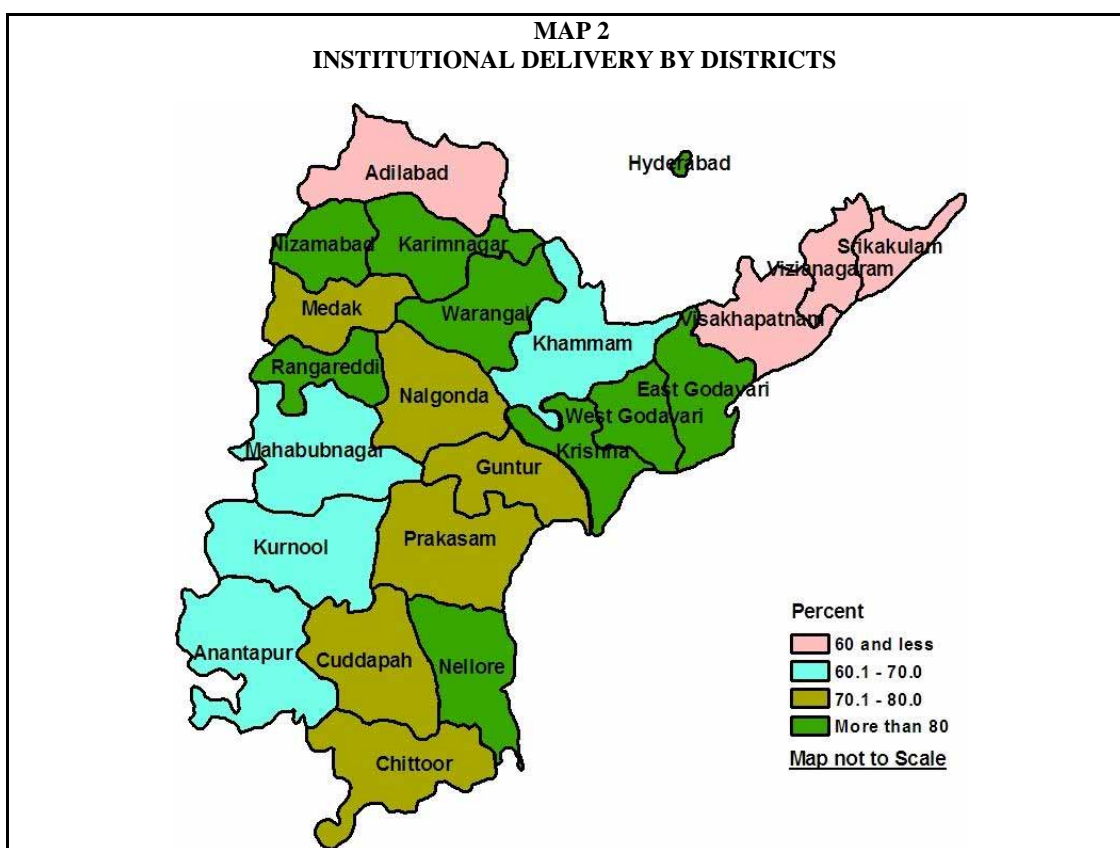

All components of ANC are more likely to be received by women in urban areas, more educated women and women in the higher wealth index. Information on sonography/ultrasound test during pregnancy was also collected during the survey. For the state as a whole, 67.8 percent of the total pregnancies ending in either still or live birth were subjected to a sonography/ultrasound test (Table 4.3). The percentage of pregnancies with an ultrasound test was more in urban areas (80.9 percent) compared to rural area (63.6 percent). It is also high among women belonging to the highest wealth quintile (88.3 percent), women with 10 or more years of schooling (86.9 percent), and women belonging to other category (78.8 percent) (Table 4.3).

Institutional Delivery

In Andhra Pradesh, the institutional delivery improved progressively from 51 percent in DLHS-1 and 61 percent in DLHS-2 to 72 percent in DLHS-3 (2007-08). The progress in institutional delivery is presented in the Figure 7.

About three-fourth of deliveries (71.8 percent) in the three year period preceding the survey which resulted either in still or live births were in health facilities, either public or private (Table 4.7). The percentage of institutional delivery ranges from 43.2 percent in Adilabad district to 95.6 percent in Hyderabad (Table 4.9). District wise variation in institutional delivery is presented in the Map 2.

In Andhra Pradesh, 75.6 percent of women had safe deliveries (institutional or home deliveries, assisted by skilled person). The better performing districts, in terms of safe delivery are Hyderabad (96.9 percent), Karimnagar (92.7 percent) and East Godavari (92.2 percent) (Table 4.9). For 28 percent of women who had home deliveries, the main reasons cited for not delivering their child in a health facility were no time to go to health facility (50.7 percent), not necessary (19.0 percent), and better care at home (15.9 percent) (Table 4.10).

In Andhra Pradesh, 22.1 percent of the deliveries which took place in institutions after January 1, 2004 have been provided with JSY financial assistance (Table 4.8). The mean cost of delivery at government health facility is lower (Rs. 2,603) as compared to private health facility (Rs. 8,401). Ten percent of women who had institutional delivery used an ambulance or jeep or car as the mode of transport and mean cost of transportation is Rs.187 (Table 4.8).

Complications during Pregnancy, Delivery and Post-delivery Period

In Andhra Pradesh, as much as 42 percent of women who had still/live births in the three years preceding the survey had some complications during pregnancy. This varies from 22 percent each in Khammam (21.9 percent) and Nellore (22.4 percent) to 67.4 percent in East Godavari district (Table 4.6). Eighty-three percent who had complications sought treatment for the problem in Andhra Pradesh (Table 4.15).

About half of the women (45.0 percent) in Andhra Pradesh had faced at least one delivery complication (Table 4.11). The main type of delivery complications experienced by women who had still or live births in the three year period preceding the survey are premature labour (70.4 Percent), prolonged labour (34.0 percent) and excessive bleeding (22.7 Percent). Reporting of delivery complication is slightly higher among the women who live in rural areas (45.2 percent) as compared to their urban counterparts (44.3 percent). Delivery complications vary from a low of 21 percent in Mahbubnagar to a high of 64.5 percent in Srikakulam district (Table 4.15).

One-fourth of women in Andhra Pradesh had post-delivery complications. The major type of post delivery complication is high fever (55.3 percent) followed by lower abdominal pain (36.4 percent) and excessive bleeding (32.7 percent) (Table 4.12). Among women who had post-delivery complications, about three-fourths of them (72.2 percent) had sought treatment (Table 4.14).

CHILD HEALTH CARE AND IMMUNIZATION

To promote child survival and prevent infant mortality, NRHM envisages new born care, breastfeeding and food supplementation at the right time and a complete package of immunization for children. Three-fourths of newborns during the three years preceding the survey was examined within 24 hours of birth (Table 5.1). Newborns to women of urban residents, newborns to women educated up to 10 or more years belonging to other castes and newborns to women in highest wealth index received more newborn care within 24 hours compared to others. Among women who availed newborn care, about three-fifths (57.1 percent) received newborn care from a private health facility, 36.3 percent from a government health facility, and 5.7 percent received new born care at home (Table 5.1).

Ninety percent of children under 3 years of age, born after January 1, 2004 were fed with colostrum and there is not much variation by residence (Table 5.2). There is visible variation across districts with at least 95 percent of children being fed with colostrum in the districts of Cuddapah, Kurnool, Guntur, Rangareddi, Anantapur and Chittoor while in the other districts it is in the range of 72 to 94 percent. Feeding of colostrum is the lowest in Nizamabad district (72.1 percent) and is the highest in Chittoor district (97.2 percent) (Table 5.5).

About half of women (46.6 percent) had initiated breast milk within one hour of birth of the child. The initiation of breastfeeding within one hour of birth is least practiced among women in Nizamabad district (27.2 percent) and most widely practiced in East Godavari (65.2 percent). Seventy-six percent of women initiate breastfeeding within 24 hours of birth of their children, ranging from 55.9 percent in Nizamabad to 87.7 percent in Khammam (Table 5.5). The proportion of women who initiated breastfeeding, within 24 hours and after 24 hours of birth to children born in the three year period preceding the survey are 75.5 and 24.5 percent respectively.

Forty-nine percent of children under two months of age are exclusively breastfed. The median duration of exclusive breastfeeding of the youngest surviving child in Andhra Pradesh is very short with only 5.4 months (Table 5.3). For those children who had started food supplementation while still breastfeeding, median age in months at the time of other fluids, semi-solid food and solid food supplementation are 6.7 months, 7.8 months and 9.8 months respectively. The proportion of youngest surviving child below 6 months of age who have exclusively breastfed is 43.3 percent (Table 5.4).

Immunization Coverage of Children Aged 12-23 Months

In DLHS-3 vaccination coverage of children aged 12-23 months has been recorded either from vaccination card or by asking the mothers in case the card was not shown. For 44 percent of children aged 12-23 months, immunization coverage of children was recorded from the card. Sixty-seven percent of children aged 12-23 months received full immunization comprising of BCG, three doses of DPT, three doses of Polio (excluding Polio 0) and measles. Only one percent of children have not received any kind of immunization (Table 5.6).

The coverage of full immunization dropped off by 12 percentage points from 75 percent in DLHS-1 to 63 percent in DLHS-2. There is however, a marginal increase of four percentage point from 63 percent in DLHS-2 to 67 percent in DLHS-3 as depicted in Figure 8.

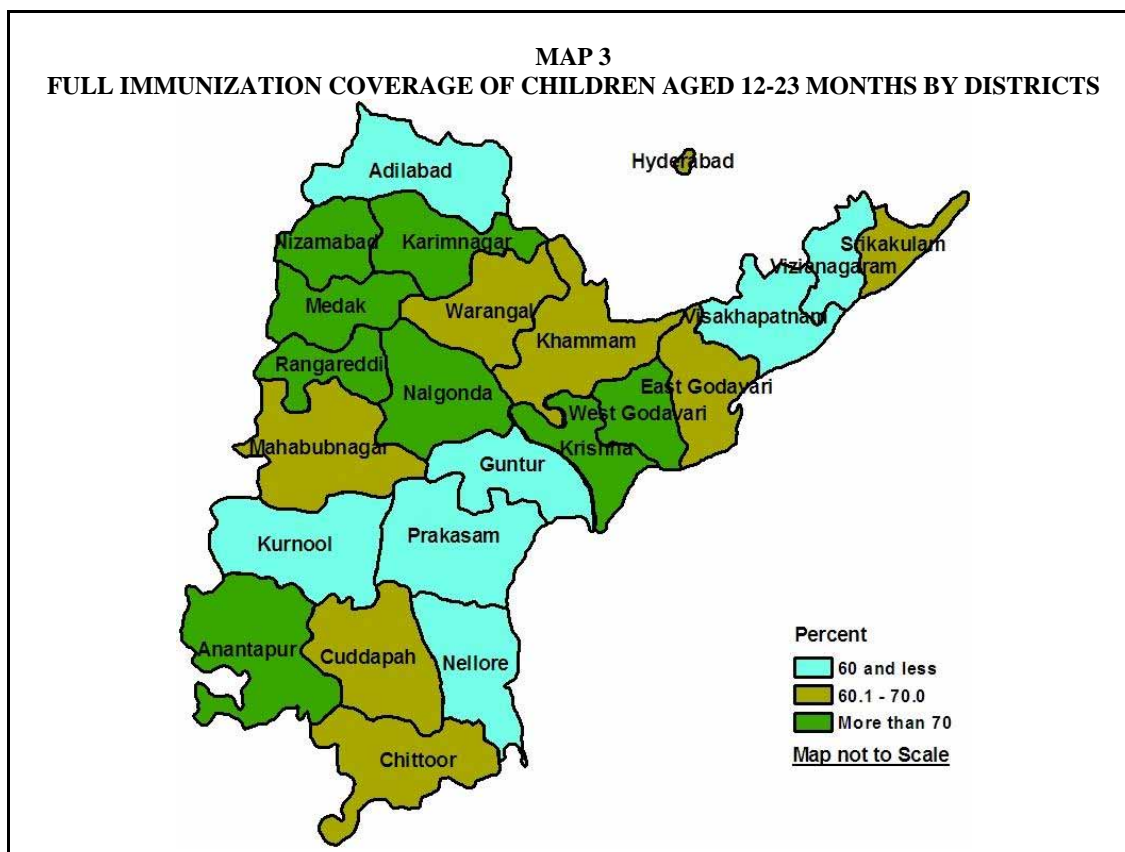

Full immunization coverage would have been well above 90 percent, if immunization against DPT did not drop down from 95 to 79 percent for first and third doses and had vaccination against polio not dropped from 98 to 82 percent for first and third dose. The key to improvement in full immunization coverage is to monitor drop out at any stage of vaccination before completion of full course of immunization. The drop out rates for DPT and polio are slightly lower in urban areas than in the rural areas. There is urban-rural gap in full vaccination by 8 percentage points. Girls (67.2 percent) are slightly more likely than boys (66.3 percent) to be fully vaccinated. Similarly, each of individual vaccination is slightly more likely to be received by girls than boys.

Birth order and vaccination shows negative relationship, with more vaccination coverage among the first birth order children. However, mother's education and wealth index has strong positive relationship with vaccination coverage. Three-fifths of children whose mothers are illiterate and thirty-five percent of children in the lowest wealth index are fully vaccinated

compared with 78.1 percent of children of mothers with 10 or more years of education and 76.6 percent of children from households in the highest wealth index (Table 5.6).

There are considerable inter-district differentials in the coverage for different vaccinations and for children receiving full vaccinations (Table 5.7). District-wise variation in coverage of full Immunization is depicted in the Map 3.

The percentage of children who are fully vaccinated ranges from 54.7 percent in Kurnool to 82.8 percent in Medak district. Karimnagar (82.5 percent), Krishna (82.9 percent) and Medak district (82.8 percent) stand out in full vaccination as more than 80 percent of children in each of these districts are fully vaccinated. Kurnool (54.7 percent) and Nellore (55.6 percent) have lower percentage of children fully vaccinated, much below the state average of 66.7 percent (Table 5.7). Similarly for individual vaccines there is inter-district differential.

The coverage of BCG in all the districts of Andhra Pradesh is above 90 percent except in Visakhapatnam (86.9 percent). All children in East Godavari, Mahbubnagar, Nalgonda, Warangal, Khammam, West Godavari and Prakasam district have received BCG vaccination. The coverage of measles vaccination is the lowest in Adilabad district (73.6 percent) and highest in Nalgonda district (99.4 percent). Coverage of third dose of DPT is the lowest in Prakasam district (62.0 percent) while the coverage of third dose of Polio vaccination is the lowest in Nellore district (69.7 percent).

As regards the place of vaccination, sixty-seven percent received vaccination from government hospital /dispensary/ UHC/ UHP/ UFWC/ CHC/ rural hospital/ mobile clinic/ *anganwadi* or ICDS centre/ pulse polio centre/ AYUSH hospital or clinic/other government health facility centre. Sub-Centre and Primary Health Centre (PHC) are equally sought as a place for vaccination of children (17 percent each) (Table 5.8).

In Andhra Pradesh, 82.9 and 50.2 percent of children between 12-35 months of age had received at least one dose and 3-5 doses of Vitamin-A supplementation respectively (Table 5.9). Children whose mother's education is 10 or more years (89.3 percent), children from highest wealth index households (87.7 percent), children from other caste groups (86.0 percent), and children at first birth order (85.0 percent) are more likely to receive at least one dose of Vitamin-A than children of non-literate mothers (76.7 percent), children from lowest wealth quintile households (62.8 percent), scheduled tribe children (67.3 percent), and children of four or more birth order (68.5 percent).

In nine districts of Andhra Pradesh, namely Adilabad (51.8 percent), Visakhapatnam (70.5 percent), Warangal (76.3 percent), Guntur (77.3 percent), Cuddapah (79.1 percent), East Godavari (81.2 percent), Vizianagaram (82.2 percent) and Nellore (82.8 percent), the coverage of Vitamin-A, is below the state average of 82.9 percent. In Medak, Nalgonda, Khammam, Krishna and Karimnagar, the coverage of Vitamin-A, is above 90 percent.

Eighty-seven percent of children had Hepatitis-B vaccination in Andhra Pradesh. Children living in urban areas, lower birth order, mother's having 10 or more years of education, and those from richest households are more likely to receive Hepatitis-B injection than children living in rural areas, 4 or more birth order, non-literate mothers, and those from poorest households.

Diarrhoea and Acute Respiratory Infection (ARI) Management

DLHS-3 collected information on knowledge of diarrhoea and ARI management from women respondents as part of assessment of child care knowledge. Seventy percent of women in Andhra Pradesh have knowledge of diarrhoea management (Table 5.10). There is differential in knowledge of diarrhoea management among women. Women in urban areas, women with 10 or more years of education and women in the highest wealth index are more likely to know about diarrhoea management than women in rural areas, non-literate women and women in the lowest wealth index.

According to UNICEF, diarrhoea can be managed at home by providing children with an increased amount of fluid or Oral Re-hydration Therapy, and a combination of usual feeding. In case of Andhra Pradesh, a sizable percentage (41 and 35 percent) of women are aware about ORS and salt and sugar solution for treating children with diarrhoea. About three-fifths of women (58.5 percent) are aware of other treatments for diarrhoea management (Table 5.10). Sixty-nine percent of children suffering from diarrhoea sought advice/treatment while forty-four percent of children suffering from diarrhoea were actually treated with ORS. Sixty-one percent of children with diarrhoea sought advice/treatment from private health facility and 37.5 percent sought treatment from a government health facility (Table 5.11).

Less than two-fifths of women (33.9 percent) are aware about danger signs of ARI in Andhra Pradesh. Awareness of different danger signs of Acute Respiratory Infection (ARI) ranges

from 26-74 percent. Seventy-one percent of women are aware of difficulty in breathing, pain in chest and productive cough (45.0 percent) and rapid breathing (35.7 percent) (Table 5.12).

Seven percent of children had suffered from ARI in the last two weeks prior to the survey. Eighty percent suffering from ARI or fever sought advice/treatment either from a private (77.0 percent) or government health facility (15.9 percent) (Table 5.12).

The percentage of children suffering from diarrhoea in the last two weeks prior to survey varies from two percent in Nellore to 13 percent in Warangal district (Table 5.13). The percentage of children suffering from diarrhoea who received treatment is lowest in Warangal (33.1 percent) and all children suffering from diarrhoea received treatment in Rangareddi district (100.0 percent). The prevalence of ARI among children varies from 0.4 percent in Hyderabad to 12.8 percent in Karimnagar district. The percentage of children who sought advice/treatment for ARI or fever ranges from 50 percent in Hyderabad to 94.7 in West Godavari, Guntur and Cuddapah received treatment.

FAMILY PLANNING AND CONTRACEPTIVE USE

To achieve population stabilization and promote healthy married life, NRHM promotes contraceptive use on voluntary basis through a comprehensive package of improved accessibility and incentive programme. The knowledge of any modern contraceptive method among currently married women is universal in Andhra Pradesh (Table 6.1). There is near universal awareness of Female sterilization for limiting and it is the most widely known contraceptive method in Andhra Pradesh. Pill is widely known contraceptive method for spacing, with 46.3 percent of women knowing about it. Other popular modern contraceptive methods for spacing are Condom and IUD (Table 6.1). Female condom is least known contraceptive method among women (9 percent). Similar pattern of knowledge and awareness of different contraceptives are also found in all the districts of Andhra Pradesh (Table 6.3).

Two-thirds of currently married women in Andhra Pradesh had ever used any contraceptive either modern or traditional method (Table 6.4). The proportion of currently married women who ever used any modern method is 67.0 percent. Female sterilization is the predominant limiting method being used by 61.6 percent of currently married women between 15-49 years and male oriented spacing temporary method like condom/*nirodh* is ever used by only 1.1 percent of husbands of currently married women. Oral pills and IUD are being ever used by 1.2 and 1.4 percent of currently married women (Table 6.4). The contraceptive prevalence rate is 4 percentage points higher in urban areas than in rural areas (rural 66.5 percent and urban 70.4 percent). Similarly, use of different contraceptive methods including traditional methods is marginally higher in urban areas than in the rural areas (Table 6.4).

Contraceptive Use

The status of current contraceptive use among currently married women or their husbands shows (Figure 9) that 66.7 percent of them are using at the time of survey, one or the other modern method, mostly female sterilization (61.6 percent). Condom/*nirodh* is in use by less than one percent of currently married women's husbands (Table 6.5A).

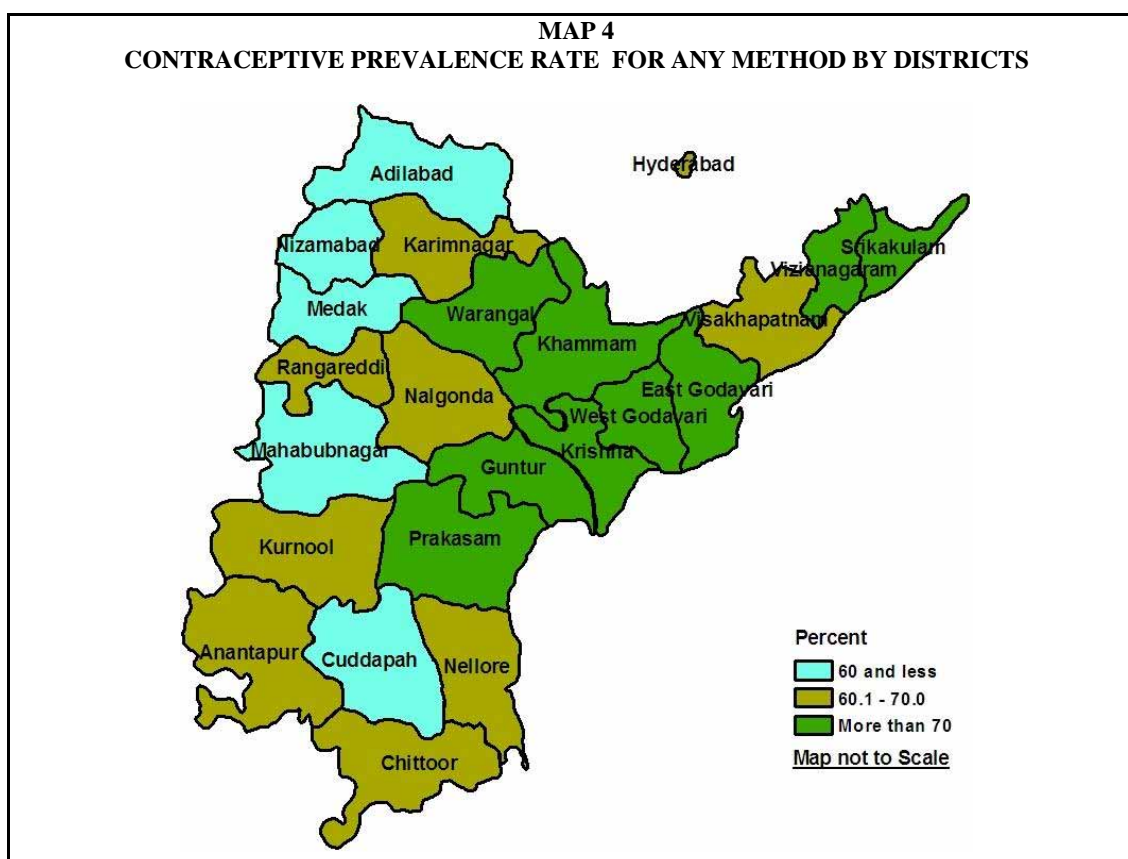

Female sterilization, regardless of family size, is more among currently married women who have one or more living sons compared to those with no living son. Thirty-three percent of women between 20-24 years, 63.2 percent of women between 25-29 years and 78.0 percent of women between 30-34 years have been found to have undergone female sterilization at the time of survey (Table 6.5A). Mean age of women at sterilization is 23.5 years (Table 6.6). Among the currently married women using IUD as a spacing method, the proportion continuing IUD for less than 2 is 43 percent (Table 6.5B). Oral of pills; users continuing for more than 6 months constitute 65.1 percent of the total users and 69.7 percent of condom users are continuing with the same method for longer than 6 months (Table 6.5B).

Contraceptive Prevalence Rate for Any Method

The contraceptive prevalence rate among currently married women is 67 percent, improved from 63 percent in DLHS-2 and 59 percent in DLHS-1. It increased marginally by 4 percent points from 63 percent during DLHS-2 to 67 percent in DLHS-3 (Figure 10).

The prevalence of female sterilization in Visakhapatnam district (45.4 percent) is much below the state average of 61.7 percent and stands the lowest in the state. Female sterilization is the highest in West Godavari district (74.7 percent). In Andhra Pradesh, the use of modern spacing methods (pill and condom) is relatively poor, with less than one percent of currently women using it. Women currently using pill is highest in East Godavari, West Godavari and Guntur district (0.6 percent each). Condom use is highest in Visakhapatnam district with 2.0 percent. Contraceptive prevalence rate (CPR) for any method is the lowest in Cuddapah district (51.2 percent) and is the highest in East Godavari and West Godavari (78.5 percent each). CPR for any method is less than 60 percent Cuddapah, Adilabad, Nizamabad, Mahbubnagar and Medak district. While in Prakasam, Warangal, Visakhapatnam, Guntur, Khammam, Srikakulam, Krishna, East Godavari and West Godavari, CPR for any method is above 70 percent ranging from 70.1 percent to 78.5 percent. District-wise variation in CPR of any method is depicted spatially in Map 4.

Seventy-nine percent sterilization had taken place in a government facility, where as only 15.2 percent women obtained their spacing method from government facility (Table 6.8).

In Andhra Pradesh, 69 percent of women who had undergone sterilization three years preceding the survey had received monetary benefit and as much as 91.1 percent of them received it at the time of discharge (Table 6.9).

In Andhra Pradesh 7.3, 44.0 and 16.6 percent of sterilized women, users of IUD and Pills were informed about the side-effects before the adoption. Eleven, 19.0 and 9.9 percent of women using the aforesaid methods have experienced side-effects or health problems (Table 6.10). The main health problems/side-effects faced by women who have undergone sterilization are body/back ache and abdominal pain (51.1 percent each), and weakness/inability to work (38.5 percent) followed by excessive bleeding (12.9 percent) as shown in the (Table 6.10).

Among the currently married women who have discontinued contraception the main cited reason is related to fertility (66.0 percent), while 11.1 percent mentioned side effects and 22.9 percent cited other reasons (Table 6.11). For the younger women, reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no living children. Eighteen percent of currently married women between 15-49 years, who were not using any contraceptive, intend to adopt limiting method and 0.8 percent intends to adopt a spacing method in future (Table 6.12). Among the women who intend to adopt either limiting or spacing method in future, 18.1 percent want to use it within 12 months and 27.9 percent

want to use it after 12 months. Hence, more than half of women (54.0 percent) are still undecided about the timing for adopting any family planning method.

Unmet Need for Contraception

Currently married women physiologically fertile for conceiving and who want more children after two or more years are considered to have unmet need for spacing. Currently married women who still are physiologically fertile for conceiving and want no more children are categorized as having unmet need for limiting.

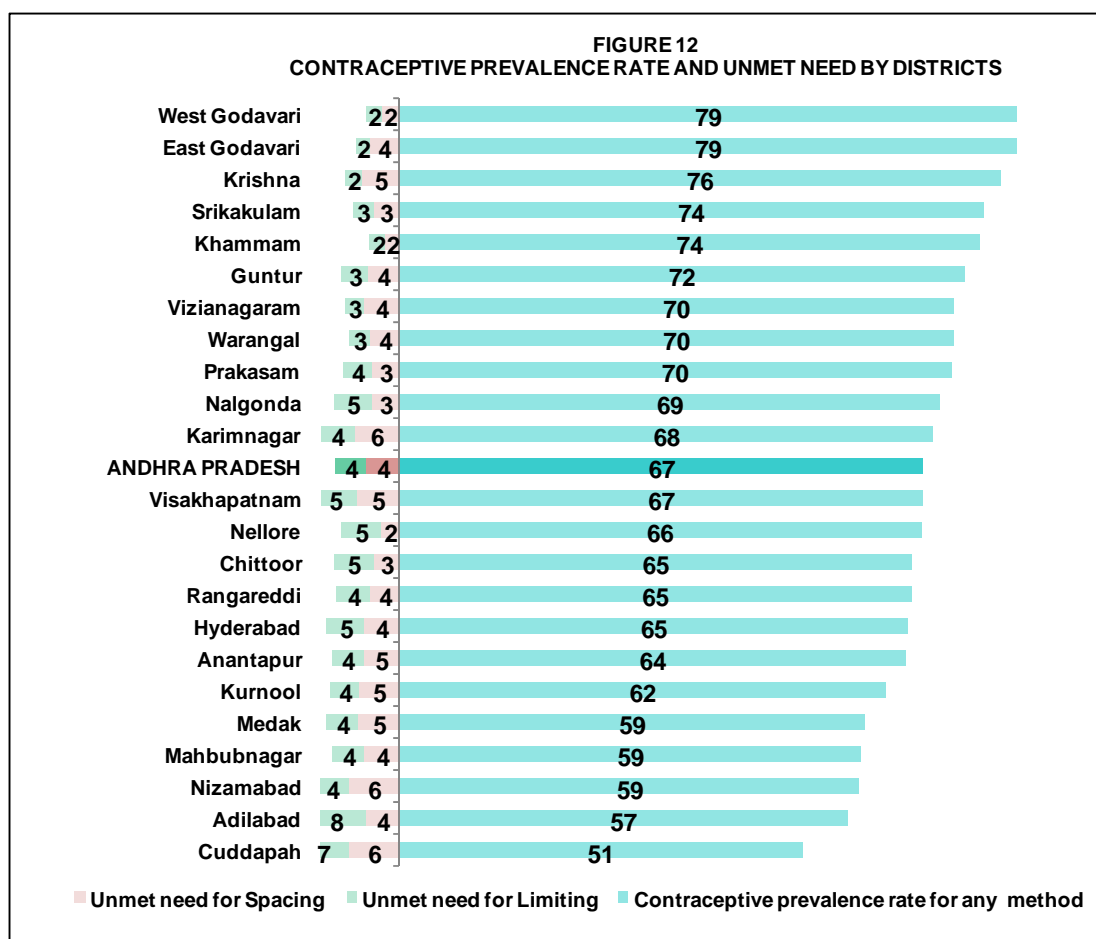

In Andhra Pradesh, the total unmet need for contraception, either for spacing or limiting is 8.1 percent, slightly lower than it was at the time of DLHS-2 (11.7 percent). The Unmet need for contraception during DLHS-2 to DLHS-3 decreased by 4 percentage points as shown in the Figure 11. The unmet need for limiting is 4.0 percent and the unmet need for spacing 4.1 percent (Table 6.15).

Unmet need for spacing is 17.2 percent for women belonging to scheduled caste, 11-17 percent for women under 25 years, 6.8 percent for rural women, 5.2 percent for women with four or more living child and 4.8 percent for women in the lowest wealth index. The unmet need for spacing is the highest in Cuddapah district (6.4 percent) and lowest in Khammam district (1.4 percent). The unmet need for limiting is 4 percent in the state; it is the highest, 7.6 percent in Adilabad district, and lowest in East Godavari district (1.6 percent) (Table 6.16). Figure 12 shows the association between unmet need and contraceptive prevalence rates by districts.

Contraceptive Prevalence Rate and Unmet Need by Districts

It can be noted that unmet need for contraception is low for districts with higher contraceptive prevalence rates. Unmet need is 12.9 percent in Cuddapah, the highest amongst the districts and the lowest in Khammam district (3.5 percent). Unmet need for spacing ranges from a low of 1.7 percent in Khammam to a high of 6.4 percent in Cuddapah district (Table 6.16). District-wise distribution of contraceptive prevalence rate and unmet need for spacing and limiting are depicted in Figure 12. Similar to the state pattern, in most districts of Andhra Pradesh, the unmet need for limiting is higher than that for spacing.

REPRODUCTIVE HEALTH AND AWARENESS OF RTIs/STIs AND HIV/AIDS

RTIs/STIs

An integrated agenda of NRHM is to promote awareness and knowledge of RTIs/STIs and HIV/AIDS and to make health facilities accessible for diagnosis and treatment seeking to ensure healthy sexual life, free from fatal infection. One of the responsibilities of health personnel is to provide correct knowledge of reproductive tract infections (RTIs)/sexually transmitted infections (STIs), HIV/AIDS and to encourage prevention and treatment.

Among ever married women between 15-49 years, 21.3 percent have experienced one or the other menstruation related problems, largely painful periods (59.5 percent) followed by irregular periods (35.2 percent), prolonged bleeding (13.8 percent) and scanty bleeding (13.1 percent) invariant of the background of the women (Table 7.1). Less than one-fourth of ever married women (23.6 percent) have heard about RTIs/STIs and it is more often heard by urban women (33.9 percent), women with 10 or more years of education (46.8 percent), women married to more educated husbands (36.6 percent) and women in the highest wealth index (40.6 percent) compared to rural women (20.0 percent), non-literate women (14.8 percent), those married to non-literate husbands (14.9 percent) and women in the lowest wealth index (9.2 percent) (Table 7.2), also shown in Figure 13.

In Andhra Pradesh relative/friends are the major source of RTIs/STIs information (58.8 percent). The other sources from which women have heard about RTIs/STIs are television (44.3 percent), health personnel (31.3 percent), print media (21.2 percent), leaders/community meetings (13.0 percent), husbands (7.3 percent), and radio (3.9 percent). Four percent of women have heard about RTIs/STIs from school/adult education programmes (Table 7.2). Among those who have heard about RTIs/STIs, 56.7, 42.0, 30.6, 22.6, 10.3 and 4.8 percent have reported unsafe sex with persons who have many partners, unsafe sex with sex worker, unsafe delivery, unsafe abortion, unsafe IUD insertion and unsafe sex with homosexuals respectively as the reasons for transmission of RTIs/STIs (Table 7.3). The knowledge about transmission varies by residence, educational attainment, husband's education and wealth index.

Twelve percent of ever married women between 15-49 years have reported having symptoms of RTIs/STIs and 7.2 percent have experienced abnormal vaginal discharge. Among women who had RTIs/STIs symptoms, 3.5 percent of women have pain in lower abdomen not related to period (Table 7.4). Two-thirds of women (66.5 percent) have discussed RTIs/STIs related problems with their husbands and among the women having RTIs/STIs symptoms; little over half of women (52.3 percent) have sought treatment, either from a government (26.2 percent) or private doctor (70.3 percent) (Table 7.5).

Khammam and Nellore are the two extreme districts regarding awareness about RTIs/STIs are concerned, with 7.1 and 38.4 percent having heard of it (Table 7.6). The seven districts where the knowledge of RTIs/STIs is above 30 percent are Visakhapatnam, Warangal, Anantapur, Mahbubnagar, Krishna, Hyderabad and Nellore. Women who have reported having abnormal vaginal discharge is least in Kurnool district (3.2 percent) and the highest in Medak district (15.9 percent). The percentage of women having any symptom of RTIs/STIs is the least in Khammam district (2.4 percent) and is the highest in Visakhapatnam district (24.7 percent). Only 33.8 percent of women with symptoms of RTIs/STIs sought treatment in Medak while 70.9 percent of women in Nizamabad district sought treatment for RTIs/STIs problem (Table 7.6).

HIV/AIDS

Seventy-two percent of ever married women between 15-49 years have heard of HIV/AIDS. The main sources of knowledge for HIV/AIDS in Andhra Pradesh are television (63.9 percent), and relatives/friends (58.3 percent). Thirty percent of women have heard about it from their health personnel, 23.3 percent from print media, 21.5 percent from leaders/community meeting and 10.8 percent of women have heard it from their husbands. Similar to source of information for RTIs/STIs, school/adult education program (6.0 percent) is not a popular source of knowledge for HIV/AIDS (Table 7.7).

The main mode of transmission of HIV/AIDS reported by women are unsafe sex with person having multiple partners (68.5 percent), transfusion of infected blood (67.4 percent), unsafe sex with sex worker (46.4 percent), mother to child (25.8 percent), unprotected sex with an HIV/AIDS infected person (23.6 percent) and unsafe sex with homosexuals (3.3 percent) (Table 7.8); also presented in Figure 14. Less than half of women in Kurnool district have heard about HIV/AIDS (48.7 percent) while in Karimnagar and Hyderabad, 88 percent of women have heard of HIV/AIDS (Table 7.13).

At the state level, only 25.8 percent of women have the right knowledge regarding the possibility of HIV/AIDS transmission from infected mother to child. Chittoor, Kurnool, Hyderabad and Khammam are the districts where the correct knowledge regarding the possibility of HIV/AIDS transmission from infected mother to child is above 40 percent. Only 11.3 percent of women in Anantapur district know that HIV/AIDS can be transmitted from infected mother to her baby (Table 7.13).

Among women who have heard of HIV/AIDS and reported that transmission of HIV/AIDS can be prevented by having sex with one partner or avoiding sex with homosexuals constitute 85.6 percent, safe blood transmission or avoiding sex with persons who inject drugs comprises of 73.1 percent, avoiding pregnancy (15.1 percent) and using condom correctly in each sexual act makes up 12.6 percent (Table 7.9). The right knowledge that HIV/AIDS transmission can be prevented by using condom is least in Nalgonda district (2.0 percent) and highest in Khammam (44.8 percent) (Table 7.13).

The most common misconception about transmission of HIV/AIDS among the ever married women is that one can get HIV/AIDS from mosquito, flea or bug bites as reported by 32.8

percent of them (Table 7.10). This misconception is more among young women age 15-19, rural, among non-literates, women with less than 5 years of education and women in the lowest wealth quintile. The proportion of women who have the misconception that HIV/AIDS can be transmitted by shaking hand, hugging, sharing clothes, sharing food and stepping on others urine/stool are 12.8, 14.5, 16.5, 19.1, and 21.4 percent respectively. Regardless of background characteristics, two-thirds of ever married women (66.8 percent) know the place where HIV/AIDS can be tested. More than four in five women in Karimnagar, Hyderabad and Nizamabad district know the place for testing and only 52.7 percent of women in Anantapur are aware of the same (Table 7.13). Half of women (50.4 percent) reported HIV/AIDS test can be done in a private hospital/clinic followed by 35.7 percent reporting government hospital/dispensary as the place for testing HIV/AIDS (Table 7.11). Thirty percent of ever married have undergone HIV/AIDS test, among them 62.7 percent have done it more than a year ago and 37.3 percent during the last one year period (Table 7.12).

INFERTILITY AND CHILDLESSNESS

Women who had primary and secondary infertility constitute 8.2 and 2.7 percent respectively of ever married women between 15-49 years (Table 7.14). Among those who had primary and secondary infertility a sizeable 75.0 percent of ever married women reported to have experienced problems in conceiving for the first time, 11.3 percent had problems in conceiving after still/live birth and 10.0 percent after undergoing induced abortion (Table 7.14). Except for the six districts in Andhra Pradesh, namely Hyderabad, Khammam, Krishna, Srikakulam, Anantapur, Mahbubnagar and Guntur where the infertility problem among ever married women is less than 10 percent, the remaining districts have infertility problem including primary and secondary infertility among ever married women ranging from 10-16 percent (Table 7.17).

Four percent of women between 20-49 years, who have been married for at least five years, are childless. Among the ever married women between 40-49 years, 2 percent of them are childless (Table 7.15). Among currently married women between 20-49 years who have been married for five years, four percent were childless and 3 percent had problem in conceiving. Among 40-49 years, 2 percent were childless and 1.7 had problem in conceiving.

Among ever married women who have infertility problem, 68.7 percent of them have taken treatment (Table 7.17), 69.7 percent for primary sterility and 65.6 percent for secondary infertility (Table 7.16). Treatment seeking behavior vary by background characteristics of women. Women in urban areas, women with 10 or more years of education, women whose husband's education is 10 years and above, and women in the highest wealth index are more likely to seek treatment for infertility problem. Over four-fifths of women with an infertility problem have sought treatment in Rangareddi, Hyderabad, Srikakulam and Karimnagar (Table 7.17). Twenty one percent of women in Andhra Pradesh have menstruation problem ranging from 15.9 percent in Rangareddi to 27.1 percent in Karimnagar district.

FAMILY LIFE EDUCATION AMONG UNMARRIED WOMEN

The objective of family life education is providing knowledge about the physiological features of women and men as they grow up and make them understand the norms of marriage and reproductive health of women. In DLHS-3 right knowledge and source of

information about RTIs/STIs, HIV/AIDS, family planning, family life education, marriage and reproductive health were collected from unmarried women aged between 15-24 years.

In all 3,945 unmarried women were interviewed in Andhra Pradesh, of which 77.9 percent were between 15-19 years and the remaining 22.1 were between 20-24 years. In rural areas unmarried women in the later age group is 17.8 percent against 31.0 percent in urban areas. About three-fifths of the unmarried women (59.2 percent) have 10 or more years of education and this proportion is 74.5 percent among urban unmarried women (Table 8.1).

Sixty-eight percent of women were aware of family life education. Non-literate women and women in the lowest wealth index are more than 2 times less likely to be aware of family life education compared to women with 10 or more years of education and women in the highest wealth index (Table 8.2). Little over two-fifth (42.8 percent) of women were of the opinion that family life education should be given by age 15-17 years. One-fourth of unmarried women felt it is important to provide family life education after reaching eighth standard while 60.9 percent felt it important to introduce by 10 or more standard (Table 8.2).

As regards the opinion on ideal persons who should impart family life education, 70.9 percent of unmarried women felt that teacher/school/college should provide them family life education, while 67.7 of them felt that parents should provide family life education and half of unmarried women were of the view that family life education should be provided to them by friends/peers (Table 8.3). One-third of the women said that it should be provided by brother or sister or sister in law. Only 9.0 percent of unmarried women mentioned that healthcare provider/sex education experts were ideal to provide such education.

Less than half of the unmarried women (47.2 percent) in Andhra Pradesh had received family life education. The main source of education is school/college (93.4 percent), followed by other sources (7.9 percent) and 7.0 percent had received family life education from a government programme/camp (Table 8.4).

It has been observed that around 88.7 percent of unmarried women aged between 15-24 years have the knowledge of minimum legal age of marriage for boys and girls (Table 8.5). Twelve percent reported ideal age of marriage for boys as less than 21 years while the remaining 87.6 percent reported more than 21 years. On the other hand, almost all women in the age group of 15-24 years reported the ideal age of marriage for girls is 18 years and above (97.7 percent).

REPRODUCTIVE HEALTH AND AWARENESS OF CONTRACEPTIVES, RTIs/STIs AND HIV/AIDS AMONG UNMARRIED WOMEN

In DLHS-3, the status of menstruation and menstruation related problems experienced by unmarried women in the three months preceding the survey were collected. About one-fourth of unmarried women age 15-24 (24.3 percent) had menstruation related problems during the last three months preceding the survey (Table 8.6). Seventy-six percent of unmarried women had menstruation related problems of which painful periods were significant ones while 27.3 percent had irregular periods. Some women had problems like prolonged bleeding, blood clots/excessive bleeding and scanty bleeding during menstruation. Not many women had problems of No period, frequent of short periods and inter-menstrual bleeding.

The practices followed during menstruation period are important from the consideration of RTI and personal hygiene. Women were asked about the practices followed during the menstrual period. Seventy-eight percent unmarried women used clothes while 26.1 percent used sanitary napkins, another 4.8 percent used locally prepared napkins during menstruation (Table 8.7).

Education on contraceptive means and methods is an integral component of family life education besides the knowledge acquired from the exposure to mass media. It is imperative to assess the knowledge of contraceptive means and methods among the unmarried women. Over three-fourth (75.8 percent) of unmarried women between 15–24 years had the knowledge of male sterilization while 93.6 percent had knowledge of female sterilization (Table 8.8). As regards spacing methods, only half of women had knowledge of pills, 55.7 percent had knowledge of condom/*nirodh* while one-fourth of them had knowledge of IUD. It is noteworthy that one-fourth of unmarried women had knowledge of emergency contraception while 30.6 percent of them are aware of injectables. With regard to source of availing pill and condom, 36.5 percent of women were of the opinion that pill and condom can be obtained from government health facilities while about half of them (47.2 percent) said it can be had from private health facility (Table 8.9).

The unmarried women were further asked about their involvement in discussion on family planning. It has been found that 17.7 percent women had ever discussed about family planning with anyone. Among those who ever discussed about family planning, over nine in ten women (92.0 percent) had discussed with friends/peers, 22.2 percent had discussed with teacher/school/college, 19.0 percent had discussed with brother/sister/sister-in-law and 12.3 percent had discussed with parents (Table 8.10).

Twenty-nine percent of unmarried women had heard of RTIs/STIs (Table 8.11). In Andhra Pradesh, Adult Education programme/school teacher (61.1 percent) is the major source of RTIs/STIs information for unmarried women. Other popular sources of RTIs/STIs information are print media (48.4 percent), television (41.2 percent), friends/relatives (40.5 percent) and health (12.7 percent) (Table 8.11).

Over two-thirds of unmarried women (68.0 percent) mentioned that RTIs/STIs can be transmitted through unsafe sex with persons who have many partners; 51.3 percent were of the opinion that it can be transmitted through unsafe sex with sex worker and another 12-30

percent were of opinion that RTIs/STIs can be transmitted through unsafe IUD insertion, unsafe abortion and unsafe delivery (Table 8.12).

Eighty-seven percent of unmarried women are aware of HIV/AIDS (Table 8.13). Sixty-eight percent of unmarried women heard about HIV/AIDS from television, 59 percent heard from newspaper books/magazines (print media) and another 16 percent heard from health personnel. Nine percent of unmarried women had heard about HIV/AIDS from radio, 8 percent from cinema and negligible few (2 percent) from adult education. Eighty-six percent of unmarried women said that HIV/AIDS can be transmitted by transfusion of blood, 66.5 percent said that HIV/AIDS can be transmitted through unsafe sex with persons who have many partners and half of them said it can be transmitted by unsafe sex with sex worker (Table 8.14). Thirty-four percent of women were of the opinion that it can be transmitted by unprotected sex with HIV/AIDS infected persons while about two-fifth of women were of the opinion that it can be transmitted from infected mother to child.

There are many misconceptions about transmission of HIV/AIDS. Five to 23 percent of unmarried women were of the view that one can get HIV/AIDS by shaking hands, hugging, sharing cloths, kissing, sharing food, stepping on urine/stools of someone who has AIDS, and by mosquito/flea or bedbugs bites (Table 8.15). These women were further asked about how to avoid or reduce the chances of getting HIV/AIDS. Over four-fifths of unmarried women felt that it can be avoided by avoiding sex with persons who inject drugs (86.7 percent) or by limiting sex with one partner/avoid sex with sex workers (85.2 percent) (Table 8.16). Twenty-four percent felt that pregnancy should be avoided when infected with HIV/AIDS while nineteen percent of women were of the view that chances of getting HIV/AIDS can be avoided if a condom is used correctly during each sexual intercourse and another nine percent of women felt that one should abstain from sex (Table 8.16). Three-fourth of unmarried women were aware of the place where HIV/AIDS could be tested (Table 8.17). They knew that it can be done at the government hospital (84.1 percent), private hospitals (43.0 percent), CHC/PHC/Sub-Centre (20.2 percent) and VCTC/ICTC clinics (3-5 percent).

In Andhra Pradesh, sixty-five percent of unmarried women knew that it was possible to know the sex of the baby before the baby was born by a medical test (Table 8.18). Majority of unmarried women knew that pregnancy cannot occur after kissing or hugging while fourteen percent of women knew that it can occur when a woman has intercourse. Twelve percent of women were of the opinion that a woman was most likely to get pregnant if she had sexual intercourse half way between her periods.

HEALTH FACILITIES - AVAILABILITY AND QUALITY

For the first time, a population linked facility survey has been conducted in DLHS-3. At the district level, all Community Health Centres (CHCs) and the District Hospitals (DH) were covered. Further, all Sub-Centres and Primary Health Centres (PHCs) which were expected to serve the population of selected PSU were also covered. The basic objective of facility survey is to collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructure at the level of Sub-Centre, PHC and CHC, in order to assess the adequacy of RCH services in rural areas. The average sampled rural population served per Sub-Centre, PHC and CHC in Andhra Pradesh are 10,702; 48,110 and 1,37,650 respectively (Table 9.1). In all 846 villages were surveyed in

DLHS-3 and the RCH services of these sampled villages were catered by 885 Sub-Centres, 646 PHCs and 162 CHCs.

About 55.3 percent of sampled villages have Sub-Centre within the villages, while the corresponding proportion is highest (84.6 percent) in Nellore district to lowest (29 percent), of Sub-Centre within the village in Chittoor district (Table 9.2). Around 84 percent of sampled Sub-Centres have an ANM/Female Health Worker (FHW) in position and in most of the districts more than 60 percent of sampled Sub-Centres have an ANM/FHW. In 63.3 percent of the sampled Sub-Centres which have an ANM, residing in Sub-Centre quarter. In the sampled Sub-Centres of Andhra Pradesh, more than 70 percent of ANMs residing in Sub-Centre quarter, in Mahbubnagar, Nalgonda, Khammam, Srikakulam, West Godavari, Krishna, Prakasam, Kurnool and Chittoor whereas no one ANMs staying in Sub-Centre quarter in Nellore district. Out of the 194 Sub-Centres in government building, 25 percent (48 Sub-Centre) have regular electricity. In 58 (29.9 percent) of the Sub-Centres located in government buildings, there are labor rooms (Table 9.3) and out of this, 24 (41.4 percent) of the labor rooms are currently in use. There is toilet facility in 96 (49.5 percent) of the sampled Sub-Centres located in public buildings and 62.9 percent of Sub-Centres house in government buildings have provision for water.

In order to assess the adequacy of the equipments in the sampled Sub-Centres, the Sub-Centres having 60 percent of essential equipments for RCH services are categorized as adequately equipped, otherwise inadequately equipped. A similar categorization of Sub-Centres having adequate stock of essential drugs for RCH services is followed. Distribution of adequately equipped Sub-Centres and Sub-Centres having adequate stock of essential drugs by districts are shown in Table 9.4. It is being noted that 675(76.3 percent) of the sampled Sub-Centres in Andhra Pradesh are adequately equipped. In all the 23 districts of Andhra Pradesh, the Sub-Centres are adequately equipped ranging from 42 percent in Prakasam to 96 percent in Medak district. 857 (96.9 percent) of the total 885 sampled Sub-Centres have adequate stock/supply of essential drugs for RCH services. Citizen's charter is displayed in 306 (34.6 percent) of the sampled 885 Sub-Centres (Table 9.5). The proportion of sampled Sub-Centres facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 88.6 and 90.4 percent respectively.

Except for the district of Rangareddi, (17 PHCs), there are PHCs serving 34-35 sampled villages in the all districts of Andhra Pradesh (Table 9.6). There is Lady Medical Officer (LMO) in all the sampled PHCs. There are LMOs in position in 262 (40.6 percent) of the 646 sampled PHCs and Medical Officers (MO) in position in 512 (79.3 percent) of the 646 sampled PHCs. Fifty-four PHCs have AYUSH doctors in position (8.4 percent) and 74.1 percent of the PHCs have Pharmacists.

Only 166 (25.7 percent) of the 646 sampled PHCs have residential quarters available for medical officer (Table 9.7). Half (51.1 percent) of the sampled PHCs is on a 24 hour basis. Eighty-three percent of the sampled PHCs catering to the sample villages have at least 4 beds. In contrast to the condition of Sub-Centre, PHC is slightly better off in having regular power supply. Two hundred and ninety four sampled PHCs (45.5 percent) have regular power supply but only 167 (25.9 percent) have functional vehicles. New born care equipments are available in 48.9 percent of the sampled PHCs, 89.0 percent have functional operation theatres and 72.4 percent provide referral services for delivery (Table 9.8).

In 612 (94.7 percent) of the 646 total sampled PHCs in Andhra Pradesh have at least 60 percent of essential drugs and 92 percent have at least 60 percent of essential cold storage systems. In all districts, PHCs have conducted at least 10 deliveries in the last one month with more than half (54.2 percent) of the PHCs in Andhra Pradesh having conducted at least 10 deliveries in the last one month. Untied funds have been utilized by 69 percent of the sampled PHCs (447 of the 646 sampled PHCs) (Table 9.9). Rogi Kalyan Samiti (RKS) has been constituted in 356 (55.1 percent) of the sampled 646 PHCs and Citizen's Charter displayed in 369 (57.1 percent) of sampled PHCs.

Not a single sampled CHC in West Godavari and Nellore which cater to the RCH services of sampled villages, have a gynecologist in position (Table 9.10). The proportion of sampled CHCs which have a Pediatrician, Anesthetist and Health Manager are 29.0, 26.5 and 3.7 percent respectively. In East Godavari and Guntur none of the sampled CHCs which provide RCH services to the sampled villages has blood storage facility (Table 9.11). For the state as a whole, 41 (28.5 percent) of the sampled 162 CHCs have blood storage facility. Overall 88.9 percent of the sampled CHCs in Andhra Pradesh are designated FRUs. Out of the 162 sampled CHCs, 131 (80.9 percent), 89 (61.8 percent) and 41 (25.3 percent) have functional operation theatres, new born care and low birth weight (LBW) management facilities. Out of the sampled 162 CHCs, 127 (78.4 percent) of them have utilized funds (Table 9.12). In 109 (67.3 percent) of sampled CHCs, RKS has been constituted and 92.7 percent of the constituted RKS are monitored regularly.

TABLES

RESPONSE RATES AND DEMOGRAPHIC INDICATORS

TABLE 1.1 NUMBER OF HOUSEHOLDS, EVER-MARRIED WOMEN & UNMARRIED WOMEN INTERVIEWED												
Number of households, ever-married women and unmarried women interviewed by district, Andhra Pradesh, 2007-08												
State/district	Number of households interviewed				Number of ever-married women interviewed				Number of unmarried women interviewed			
	Total	Rural	Urban	Response rate	Total	Rural	Urban	Response rate	Total	Rural	Urban	Response rate
Andhra Pradesh	25,321	18,793	6,528	90.5	21,730	16,176	5,554	84.8	3,945	2,648	1,297	77.9
Adilabad	1,029	770	259	93.6	930	700	230	87.8	226	155	71	82.2

Andhra Pradesh (15-49)	4.1	4.0	8.1	19,832
Andhra Pradesh (15-44)[†]	4.5	4.0	8.5	18,077

Note: Total unmet need refers to unmet for limiting and spacing.

** Unweighted cases.

¹ Unmet need for spacing includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing.

² Unmet need for limiting includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and do not want any more children but are currently not using any family planning method. Total unmet need refers to unmet for limiting and spacing.

^a Literates but did not attend school, are also included.

[†] Represents figures for currently married women aged 15-44 years.

TABLE 6.16 UNMET NEED FOR FAMILY PLANNING SERVICES BY DISTRICT

Percentage of currently married women age 15-49 years by unmet need for family planning services by districts, Andhra Pradesh, 2007-08

District	Unmet need for FP			Number of women**
	Spacing ¹	Limiting ²	Total	
Adilabad	4.2	7.6	11.8	835
