IMPORTANT INSTRUCTION TO READER:

This report is based on data collected from 32,261 households from Jharkhand during 2007-08. From these households, 26,886 ever-married women aged 15-49 years and 5,063 unmarried women aged 15-24 years were interviewed. Most of the tables and analysis presented in the report is based on ever-married women aged 15-49 years. However, for the purpose of comparison with DLHS-2 (2002-04) and the Fact Sheet of DLHS-3, we also provided some indicators based on currently married women aged 15-44 years in selected tables. We request the readers to keep this distinction in mind while using and comparing the DLHS-3 indicators with other surveys.

For more information, visit DLHS website: <http://www.rchiips.org>.

Preface and Acknowledgements

The District Level Household and Facility Survey (DLHS-3) is a nationwide survey covering 601 districts from 34 states and union territories of India. This is the third round of the district level household survey which was conducted during December 2007 to December 2008. The survey was funded by the Union Ministry of Health and Family Welfare, United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

We are very grateful to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for the DLHS-3 Project and providing an opportunity to work closely with the health and programme officials. In particular, we would like to thank Ms. K. Sujatha Rao, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for her advice, suggestions and support. We also thank Shri Naresh Dayal, former Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for the advice and valuable support extended to the project. Our special thanks to Smt. Madhu Bala, the Additional Director General, Dr. Rattan Chand, the Chief Director and Shri. Rajesh Bhatia, the Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their active involvement and suggestions. We are also thankful to Dr. V.K. Malhotra and Shri S.K. Das, former Additional Director Generals, Shri Partha Chattopadhyay, former Chief Director, Shri K. D. Maiti, former Director and Ms. Rashmi Verma, former Deputy Director-Statistics Division, MoHFW, Government of India for the co-operation and support at various stages of this project.

We are grateful to Late Dr. P. N. Mari Bhat, former Director, IIPS and Prof. S. Lahiri, for their keen interest and guidance in the initial stages of the project. We acknowledge the contributions of the Academy of Management Studies, Lucknow, the Regional agency for the field implementation of DLHS-3 in Jharkhand state. The monitoring of the field survey was done independently by Population Research Centre, Orissa under the guidance of National Institute of Health and Family Welfare, New Delhi.

Our thanks to the members of Technical Advisory Committee (TAC) of DLHS-3 and especially to its Chairman, Dr. P. M. Kulkarni, Professor, Jawaharlal Nehru University, New Delhi. We also thank Dr. N.K. Singh for guiding the software development and CSPro training for the project staff. We gratefully acknowledge the immense contributions of DLHS-3 project team at IIPS in developing survey instruments, training field staff, monitoring field work, data processing, preparation of district and state level fact sheets, and drafting the reports.

Finally, special thanks to all respondents who spared their valuable time and cooperated with us by providing the required information.

**DLHS-3 Coordinators
International Institute for Population Sciences**

BACKGROUND AND OBJECTIVES OF THE SURVEY

The National Rural Health Mission (2005-2012) was launched by the Government of India (GoI) in 2005-06 to provide effective health care to rural population in the country with special focus on states which have poorer health outcomes and inadequate public health infrastructure and manpower. The primary focus of the mission is to improve access of rural people, especially women and children, to equitable and affordable primary health care. The main goal of NRHM is to reduce infant mortality rate (IMR) and maternal mortality ratio (MMR) by promoting newborn care, immunization, antenatal care, institutional delivery and post-partum care.

The National Rural Health Mission (NRHM) foundation is built on community involvement in drawing a village health plan under the auspices of Health & Sanitation Committee of the Panchayat, making rural primary health care services accountable to the community and giving authority to the District Health Mission for implementation of inter-sectoral District Health Plan including drinking water, sanitation, hygiene and nutrition. The interface between the community and the public health system at the village level is entrusted to a female Accredited Social Health Activist (ASHA), a health volunteer receiving performance based compensation for promotion of universal immunization, referral and escort services for reproductive & child health (RCH), construction of household toilets, and other health care delivery programmes. To promote institutional delivery, cash incentive programme under Janani Suraksha Yojana (JSY) is made an integral component of NRHM.

The third round of District Level Household and Facility Survey (DLHS-3) carried out during 2007-08 was designed to collect data at district level on various aspects of health care utilization for RCH (Reproductive & Child Health), accessibility of health facilities, assess the effectiveness of ASHA and JSY in promoting RCH care, to assess health facility capacity and preparedness in terms of infrastructure. The integration of facility survey with the household survey was done with a view to link the RCH care outcomes to health facility accessibility, availability of medical & paramedical manpower and other village infrastructures. The broad objective of DLHS-3 is to provide RCH outcome indicators at the district level in order to monitor and provide corrective measures to the NRHM. The other important objective being, to assess the contribution of decentralization of primary health care at the district level and below by way of involving village health committees under the Panchayats in the implementation of health care programmes.

The main focus and objective of DLHS-3 is providing RCH indicators covering the following aspects:

- Coverage of antenatal check up and immunization services
- Institutional/safe deliveries
- JSY Beneficiaries
- Contraceptive prevalence rates
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTIs/STIs and HIV/AIDS
- Family life education among unmarried adolescent girls
- Health facility and infrastructure

The District Level Household and Facility Survey, 2007-08 (DLHS-3) is the third in the series of district level household surveys. The first one was conducted in 1998-99 followed by the second in 2002-04. For all the three DLHS, the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI) designated the International Institute for Population Sciences (IIPS), Mumbai, as the Nodal Agency responsible for the development of survey design, instruments, data entry and tabulation software, training, supervision of field work, analysis and report writing. The sources of funds for DLHS-3 are the MoHFW, GoI and United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

A Technical Advisory Committee (TAC) constituted by the MoHFW, GoI guided the designing, implementation, progress, tabulation, basis of selection of RCH indicators and consistency issues.

SURVEY DESIGN, SAMPLE SIZE AND DESIGN WEIGHT

A multi-stage stratified systematic sampling design was adopted for DLHS-3. In each district, 50 primary sampling units (PSUs) which were census villages in rural areas and census enumeration blocks (CEBs) in urban areas. In rural areas, villages were selected by probability proportional to size (PPS) systematic sampling and in the second stage households were selected by systematic sampling. For urban areas first wards were selected by PPS systematic sampling, in the second stage CEBs by PPS sampling and households in the third stage by systematic sampling. The Census of India, 2001 was the sampling frame for DLHS-3. All villages and urban wards in a district were stratified by household size into three strata of less than 50, 50-300 and 300+ households, percent of SC/ST population into two strata- below and above 20 percent and implicitly by three alternating order of female literacy. These variables used for stratification are from the 2001 Census. The number of households representing a district is either 1000 or 1200 or 1500 considering the levels of immunization, antenatal check up and institutional delivery as given by DLHS-2 plus 10 percent over sampling to cushion for non-response. The PSUs are allocated to rural and urban areas of each district proportionally to the actual rural-urban population ratio and within the rural-urban domains. The PSUs are further distributed proportionately to the different sub-strata of combinations of household size, percent of SC/ST population and levels of female literacy. To make a proper rural PSU, selected villages with less than 50 households were linked with another contiguous village and selection probability is adjusted accordingly. Selected villages with more than 300 households were further divided into two or more segments and one or more segments were selected so as to have standard size PSUs. The numbers of households drawn from PSUs of districts represented by 1000, 1200 and 1500 households are 22, 27 and 33 households respectively. All ever married women age 15-49 years and adolescent's age 15-24 years from the sampled households are the respondents for questions on RCH and family life education, while any adult household member is the respondent for household related questions in DLHS-3.

Sampling weight for household, ever married women and unmarried women were generated for each district. These design weights were used for computations of district level demographic and RCH indicators. The selection probabilities f_1^i , f_2^i and f_3^i at different stages of randomization pertaining to the i^{th} PSU of a district were the main inputs for generation of design weight. These selection probabilities are defined as follows:

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ rural PSU in a district}$$

$$= \frac{(n_r * H_i)}{H}$$

Where, n_r is the number of rural PSUs selected from a district, H_i refers to the number of household in the i^{th} psu and $H = \sum H_i$, total number of rural households in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU}$$

(in case the i^{th} selected PSU is segmented)

= (Number of households in the selected segment) / (number of households in the PSU)

The value of f_2^i is to be equal to one for un-segmented PSU.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= \frac{HS_i}{HL_i}$$

Where HL_i is the number of households listed in i^{th} PSU in a district and HS_i the number of households per PSU assigned for the i^{th} PSU is either 22 or 27 or 33 depending on whether a district is represented by 1000 or 1200 or 1500 households.

For urban PSUs, f_1^i is computed as the ratio of urban population of the selected PSU to the total urban population of the district.

The probability of selecting a household from the district works out as:

$$f^i = (f_1^i * f_2^i * f_3^i)$$

The non-normalized household weight for the i^{th} PSU of the district is, $w^i = \frac{1}{f^i * HR_i}$, where HR_i

is the household response rate of the i^{th} sampled PSU, assumed to be 10 % but actual response rates are used here. The normalized weight used in the generation of district indicators as

$$N_i^d = \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i, i= 1, 2, 3, \dots, 50.$$

Where n_i is the number of households interviewed in the i^{th} PSU. The weight for women is computed in the similar manner after multiplication of expression for f^i by the corresponding

response rate. State weights for households, women and husbands are further derived from the district weights n_i^d for the i^{th} psu in d^{th} district using external control so that sample results do not deviate from the corresponding information about the population.

Let, $n_s = \sum_i n_i^d$ and $N_{sc} = \sum_i N_i^d$, denote the number of households in the sample and census of a particular state, then state level households weights work out as:

$$n_i^s = n_i^d * \frac{\left(\frac{N_i^d}{N_{sc}} \right)}{\left(\frac{n_i^d}{n_s} \right)}, \text{ where } n_i^d \text{ represents household sample in } i^{\text{th}} \text{ district, } n_s \text{ is the total}$$

sample in the state. These households' weights are computed for rural-urban areas separately. Considering sample and census currently married women age between 15-49 years and married males above 15 years for specified state by districts and rural-urban residence, state level women weights are obtained for estimation of state level indicators.

IMPLEMENTATION AND QUALITY CONTROL

Actual field operation of DLHS-3 in different states and union territories were implemented by Regional Agencies (RA) selected by the MoHFW through a competitive bidding process, Academy of Management Studies, Lucknow was designated as RA for implementation of DLHS-3 in Jharkhand. Data from the selected PSUs were collected by a team of 5 persons consisting of one Supervisor, one field Editor and three Female Investigators who are at least graduates. A minimum of two days visit to each sampled PSU is followed to ensure 100 percent coverage of selected households, ever married women and unmarried women. Independent team of Health Investigators, mostly paramedics were entrusted the work of carrying out the accompanying Facility Survey. A strict quality check protocol was put in place by the Nodal Agency by way of spot and back checks by an independent team. The Quality team comprised of two females and one male investigator and was headed by a Research Officer from the monitoring agency. One Research Officer from IIPS was stationed in each state throughout the period of the field work for supervising the survey operations.

SURVEY INSTRUMENTS

The main instrument for collection of data in DLHS-3 was a set of structured questionnaires, namely, household, ever married woman, unmarried woman and village questionnaires. Sub-Centre, Primary Health Centre (PHC), community health centre (CHC) and District Hospital (DH) questionnaires were used to conduct the facility survey. All household level questionnaires were bilingual, with questions in regional and English languages.

Household Questionnaire

The household questionnaire lists all usual residents in each sample household including visitors who had stayed the night before the interview. For individual household member information on age, sex, marital status, education and relationship to the head of the household were collected. Marriages and deaths of members of household were also recorded. Efforts were

made to get information about maternal deaths. Information was also collected on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, ownership of durable goods in the household, religion and caste of household head. The other information collected relates to awareness of government programmes.

Ever Married Women's Questionnaire

The respondents for the ever married women's questionnaire were ever married women age 15-49 years living in the sampled households. Details on age, age at marriage and place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Details about antenatal check-up, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use, sex preference of children and fertility intentions were recorded. For the recent births, immunizations status of children was collected either from the immunization card or by asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTIs/STIs and HIV/AIDS by source and treatment seeking behaviour for RTIs/STIs.

Unmarried Women's Questionnaire

Information that was collected from unmarried women age 15-24 years (those under 18 years with consent from the parents) included knowledge of family life education, awareness about legal age at marriage, awareness about contraception, menstruation related problems, and knowledge of RTIs/STIs and HIV/AIDS by source of information.

Village Questionnaire

This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at village level. Functioning of village health committees and utilization of untied funds were additionally collected from the sampled villages of DLHS.

Facility Survey Questionnaires

In the facility survey the information collected at the Sub-centre level were availability of human resources, physical infrastructure, equipments and essential drugs and RCH service provided during the one month preceding the survey. Additional information collected at Primary health centre (PHC) level was availability of Lady Medical Officer, functional Labour Room, Operation Theatre, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that was collected for Community health centre (CHC) included status of in-position clinical, supporting and Para-medical staffs, availability of specialists trained for NSV (Non Scalpel Vasectomy), emergency obstetric, medically terminated pregnancy (MTP), new born care, treatment of RTIs/STIs, IMNCI, ECG etc. Physical infrastructures of CHC such as, water supply, electricity, communication, waste disposal facilities, OT, Labour Room and availability of residential quarters for medical doctors were also collected in the facility survey. (The questionnaires are available at DLHS-3 website: www.rchiips.org).

HOUSEHOLD AND VILLAGE BACKGROUND

DLHS-3 Coverage and Response Rate

DLHS-3 surveyed a total of 32,261 households, 26,886 ever-married women and 5,063 unmarried women in Jharkhand. The response rates are 96.9, 85.2 and 79.5 percent for households, ever-married and unmarried women respectively. The household response rate is above 90 percent in all the district of Jharkhand, except for the district of Ranchi (83.3 percent). The response rate of ever-married women varies from 76.0 percent in Palamu to 94.1 percent in Lohardaga. Similarly, the response rate for unmarried women varies from a low of 56.9 percent in Simdega to 91.6 percent in Lohardaga (Table 1.1). As far as the demographic indicators of Jharkhand are concerned, it can be noted from 2001 census that the overall sex ratio of 941 females per 1,000 males is above the national figure of 933. Sex ratio is lowest in Dhanbad with 874 females per 1,000 males. In Kodarma district, females slightly exceed males, the sex ratio being 1,001 females per 1,000 males (Table 1.2).

Village Characteristics

As regards the accessibility of health facilities to the sampled villages, 29.6 percent of villages have Sub-Centres within the village itself and as many as 77.9 percent of the villages are within 5 km. distance from a Sub-Centre. None of the villages in Jharkhand have a government dispensary within the village and only 1.2 percent has Primary Health Centres (PHC). Seven percent of the sampled villages have private clinics within the village (Table 2.11). In Jharkhand, 30 percent of villages have a government health facility. About one-fifth (18.6 percent) of the rural population are treated by doctors and it varies from 4.2 percent in Godda to 36.4 percent in Purbi (East) Singhbhum district. Most of the villages in Jharkhand (94.2 percent) have an *anganwadi* worker while only 54.1 percent of villages have an ASHA (Table 2.12).

Household Characteristics

DLHS-3 surveyed a total of 1,81,183 persons (Table 2.1) from 32,261 households (Table 2.8) in Jharkhand covering all the twenty-two districts of which 85.3 percent are in rural areas and the remaining 14.7 percent are in urban areas. In Jharkhand, 67.2 percent of household heads are Hindu, 9.5 percent are Muslims and 6.9 percent are Christians. Five percent of household heads are females. About two-fifth of household heads belong to other backward classes (39.6 percent), 36.2 percent belongs to scheduled tribe, 13.6 percent belongs to scheduled castes and 10.6 percent to others. The median age of household heads is 45 years. The average household size in the state is 5.6 persons and there is only a marginal difference in rural and urban areas (Table 2.7).

Only one-third of households (32.5 percent) in Jharkhand have electricity connection. There is huge urban-rural gap in having electricity connection. While 91.6 percent in urban areas have electricity, only 22.3 percent in rural areas have the same. Little over half of household have improved source of water, with only 4.5 percent of the households having access to piped water for drinking into dwelling/yard/plot, 13.1 percent of households have provision for flush toilet and 6.3 percent of households use LPG for cooking. About three-fourths of households (73.5 percent) live in *Kachha* houses and only 13.5 percent live in *Pucca* houses. Fifty-two percent of households have at least 3 rooms (Table 2.8). For the state of Jharkhand, 33.0 percent of

households have BPL (below poverty line) cards and it varies from a low of 17.1 percent in Bokaro to a high of 50.9 percent in Pashchimi (West) Singhbhum (Table 2.9).

Household Wealth Index

Combining household amenities, assets and durable goods, a wealth index is computed at the national level and divided into quintiles. Households are categorized from the poorest to the richest groups corresponding to the lowest to the highest quintiles at the national level. Based on national cut-off points, over two-fifths of households in Jharkhand (43.4 percent) of the households are in the lowest wealth quintile and only 8.8 percent of households are in the highest wealth quintile. In rural areas over half of households (50.5 percent) are in the lowest wealth quintile and only one percent is in the highest wealth quintile. In urban areas more than half of the households (51.8 percent) are in the highest wealth quintile, and 2 percent are in the lowest wealth quintile shown as in Fig. 1.

Age-Sex Composition

The overall sex ratio in Jharkhand is 929 females per 1000 males. The age-sex pyramid (Fig.2) depicts a scenario of declining fertility with shrinking base of 11.0 percent of the total population below 5 years. Thirty-eight percent of the total population is below 15 years and 4 percent of the population is above the age of 65 years. The remaining 58.3 percent of the population is in the 15-64 years age group. There are more children (39.2 percent) in rural areas than in urban areas (29.9 percent) (Table 2.1).

The mean age at marriage of boys and girls in Jharkhand are 22.9 and 18.3 years respectively. In Jharkhand 32.3 percent of boys and 35.9 percent of

girls were married before the minimum legal age for marriage. In Jharkhand boys getting married below legal age is highest in Dumka (47.4 percent) and lowest in Purbi (East) Singhbhum (11.6 percent). Similarly percentage of girls getting married below legal age is highest in Kodarma and Deoghar (54.9 percent each) and lowest in Simdega (13.0 percent) (Table 2.3).

Literacy by Age and Sex

Thirteen percent of the population age 7-9 years are non-literate and non-literacy is 2.3 percentage points higher for female. The gender gap in literacy rate is narrow for age group 7-9 and 10-14 years ranging from 2-6 percentage points. However for the age group 15-19 years, there is gap in literacy rate by 17 percentage points (Table 2.4), also shown in Fig. 3.

Among female children, there is noticeable decline in literacy with increase in age. The information on main reasons for dropping out of school was also collected in DLHS-3. Among girls below 18 years, who dropped out of school, as much as 30.5 percent stated that they were required for household work, followed by 16 percent of girls who stated further education is not necessary and 9.8 percent stated cost too much. Similarly, among boys, the main reported reason for dropping out of school is work related that is required for outside work (22.0 percent), required for household work (20.5 percent) and cost too much (9.9 percent)(Table 2.6).

CHARACTERISTICS OF WOMEN AND FERTILITY

Age at consummation of marriage is at least 18 years for 46.4 percent of ever married sampled women age between 15-49 years irrespective of residence. Proportion of women who are illiterate is more in rural areas (69.3 percent) than in urban areas (27.8 percent). Compared to non-literate women, the proportions of husbands who are non-literate are relatively lower in both rural and urban. In Jharkhand, only 11.1 percent of married women and 25.3 percent of married men have at least 10 years education. Little over two-fifths (42.3 percent) of ever married women were married for 15 years or more and 17.2 percent of ever-married women were married for less than 5 years. The distribution of ever-married women in the categories of 5-9 and 10-14 years of marital duration are almost uniform with at least 20 percent in each category. In Jharkhand, two-fifth and 9 percent of women belongs to households in the lowest and highest wealth index respectively. About half of ever-married women in rural areas belong to households in the lowest wealth index and only 1.7 percent belongs to households in the highest wealth index. The corresponding proportion is just the opposite for women in urban areas, with 1.9 percent of women belonging to households in the lowest wealth index and 51.2 percent in the highest wealth index (Table 3.1).

Mean Children Ever Born by Districts

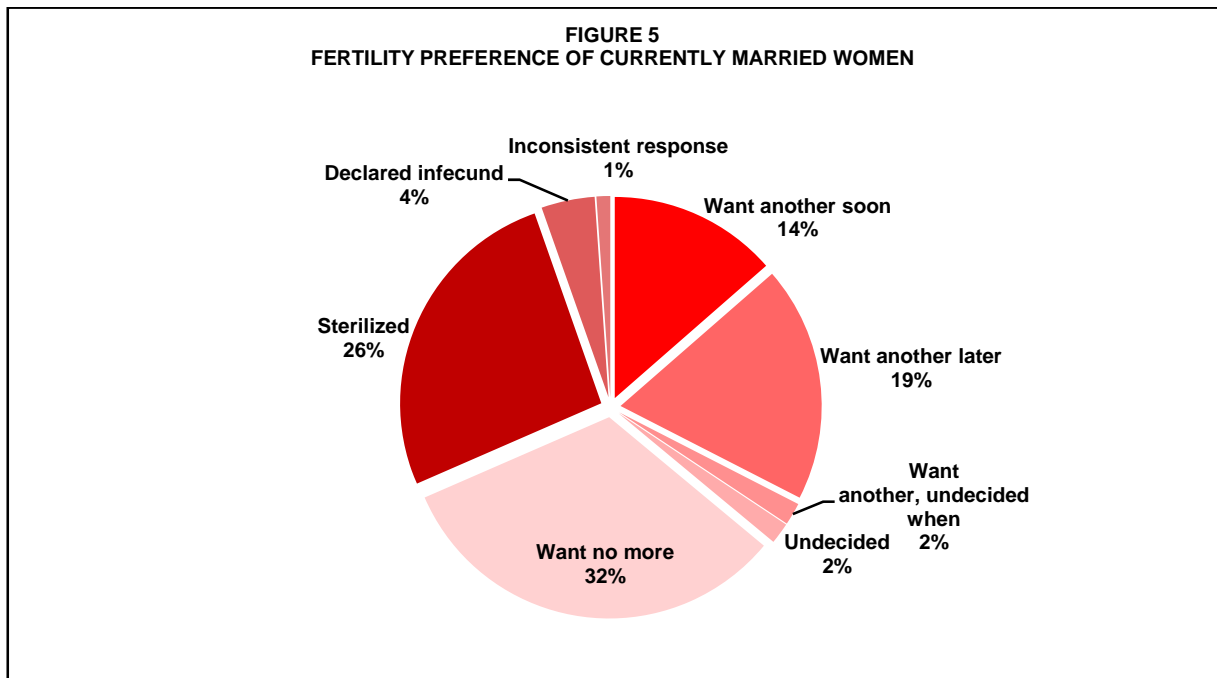

Mean children ever born (CEB) to ever married women age between 15-49 years is found to be 2.9 with small differential by residence (3.0 in rural and 2.7 in urban), while it is 3.3 for non-literate and 2.0 for women with at least 10 years of education. The completed fertility measured in terms of average children ever born to ever married women age between 40-49 years is 4.4 (Table 3.5). Districts wise distribution of CEB depicted in the fig 4.

Out of the births to ever married women during the three year period preceding the survey, 47.5 percent were of third or higher order births and the corresponding figures were 56.3 and 23.0 percents for non-literate and for the ever-married women with 10 more years of schooling respectively (Table 3.3). The births of third and higher order were more among the ever married women who live in rural areas (48.8 percent), women belonging to households in lowest wealth quintile (53.9 percent), and those belonging to scheduled tribe (52.4 percent) compared to ever-married women in urban areas (33.8 percent), belonging to other castes (39.7 percent), and those belonging to highest wealth quintile (24.0 percent). With increase in education and wealth index, there is decrease in births of third and higher order. Births of third and higher order are highest in Gumla (56.8 percent) and lowest in Purbi (East) Singhbhum (27.9 percent). (Table 3.4).

Fertility Intention and Preference of Currently Married Women

Fertility intentions of currently married women in terms of desire for additional child and timing to have the desired additional child by number of living children are given in Table 3.6. Among those with no living children, more than half of women (53.8 percent) want a child soon within the next two years and 30.5 percent want a child 2 or more years later. Among the currently married women with one living child, the proportion of women wanting an additional child soon within 2 years and after 2 years are 22.2 and 50.1 percents respectively. As many as 32.5 percent of currently married women want no more children, 13.6 percent want a child soon, 1.7 percent are undecided and 26.2 percent have undergone sterilization (Fig.5). Among the currently married women with no living children but want a child, about one-thirds of women (32.4 percent) reported that sex of the child does not matter, about half (49.4 percent) said it is up to god, 16.5 and 1.8 percent want a boy and a girl child respectively. With increasing number of living children, longing for a boy among the currently married women who want an additional child, becomes more and more magnified from 34.4 to 66.3 percent for women with one and 4 or more living children (Table 3.6).

Most of the outcomes (96.6 percent) of pregnancies which occurred during the three years period preceding the survey to currently married women age between 15-49 years are found to be live births. In Jharkhand, 2.2 percent of the pregnancies in the three years period preceding the survey resulted in spontaneous abortion and varies from 0.4 percent in Pakaur to 5.2 percent in Hazaribagh (Table 3.8).

MATERNAL HEALTH CARE

Maternal health care package of antenatal care is the main programme of NRHM to strengthen RCH care. ANC provided by a doctor, an ANM or other health professional comprises of physical checks, checking position and growth of foetus and giving TT injection at periodic intervals during the time of pregnancy. At least three check-ups are expected to complete the course of ANC to safeguard women from pregnancy related complications. Institutional delivery and post-natal care in a health facility is promoted in NRHM through the Janani Suraksha Yojana (JSY) to prevent maternal deaths.

Any ANC by Selected Background Characteristics

Among women who had their last live/still birth in the three year period preceding the survey, less than three-fifths of women (55.8 percent) received at least one antenatal check, 25.5 percent from government health facility and 44.3 percent from private health facility and 6.8 percent from community based services (Table 4.1).

A distinctive feature is that any ANC increases sharply with education and wealth index. Any ANC is 45.2 percent among non-literate as against 91.0 percent among women educated for 10 or more years and 43.2 percent among women in lowest wealth index as against 95.5 percent among women in the highest wealth index. There is huge rural-urban gap of 31.6 percent points in availing any ANC, with 84.5 percent among urban residents and 52.9 percent among rural residents (Table 4.1) also depicted in Fig. 6.

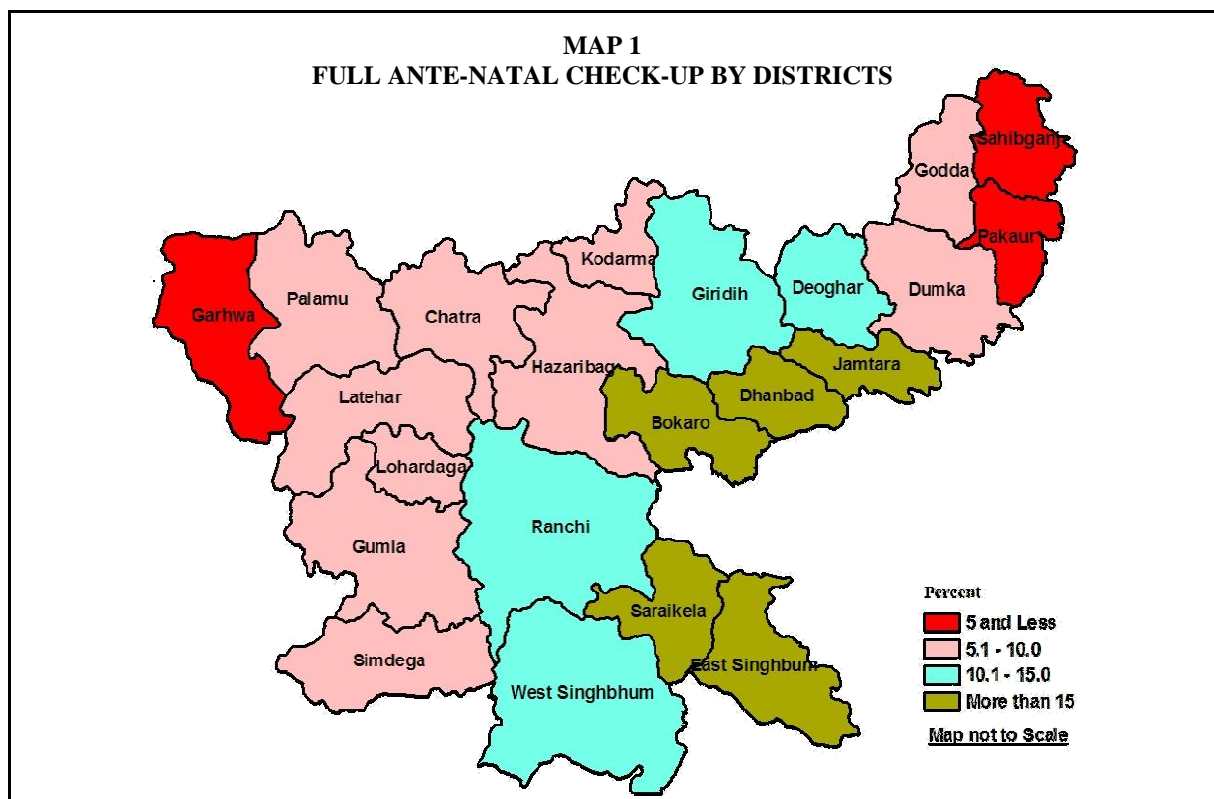

The coverage of ANC was highest in Hazaribagh (74.7 percent) and lowest in Giridih (38.5 percent). In all districts of Jharkhand, women availed ANC service from either a government or private health facility or from both the facilities, mainly from private health facility (44.3 percent). Women in Garhwa stand highest in the state for availing ANC from a government health facility (39.7 percent) while women in Bokaro (73.2 percent) stands highest in availing ANC from a private health facility (Table 4.2).

Even when women receive ANC, all checks and examinations recommended for ANC to monitor high risk pregnancy are not availed by women who had ANC during pregnancy. Among women receiving ANC, 30.7 percent of women had an abdominal examination, 33.3 percent had their weight measured and 22.9 percent had their blood pressure checked. Blood and urine test were conducted for 26.1 and 27.8 percent of women respectively (Table 4.3). All of these checks and measurements are more likely to be received by women in urban areas, more educated women, and women in the higher wealth index.

For the state as a whole, 8.7 percent of the total pregnancies ending either in still or live births are subjected to sonography/ultra sound test. Sonography/ultra sound test is about six times higher in urban areas (34.4 percent) compared to rural areas (6.0 percent). It is also high among women belonging to households in the highest wealth index (53.9 percent) and women with 10 or more years of education (36.2 percent) (Table 4.3).

The utilization of antenatal care services differ by districts. In Jharkhand, the proportion of women who received at least three ANC is 30.5 percent and 30.8 percent of women had received first ANC in the first trimester of the pregnancy (Table 4.5A). Fifty-five percent of women had received at least one TT injection, 56 percent of women consumed 100 IFA tablets. Purbi(East) Singhbhum ranks highest in the percentage of women with antenatal check-up in the first trimester of pregnancy (59 percent), with three or more antenatal care visits (57.3 percent), and in having women with at least one tetanus toxoid injection (82.6 percent). Giridih district ranks highest in percentage of mothers who had 100+IFA tablets/syrup (73.9 percent) while Garhwa district has the highest number of women suffering from any complications (80.3 percent). Besides, Purbi Singhbhum, the other districts that perform relatively well in all of these indicators are Hazaribagh, Seraikela, Godda, Borako and Dhanbad district (Table 4.6).

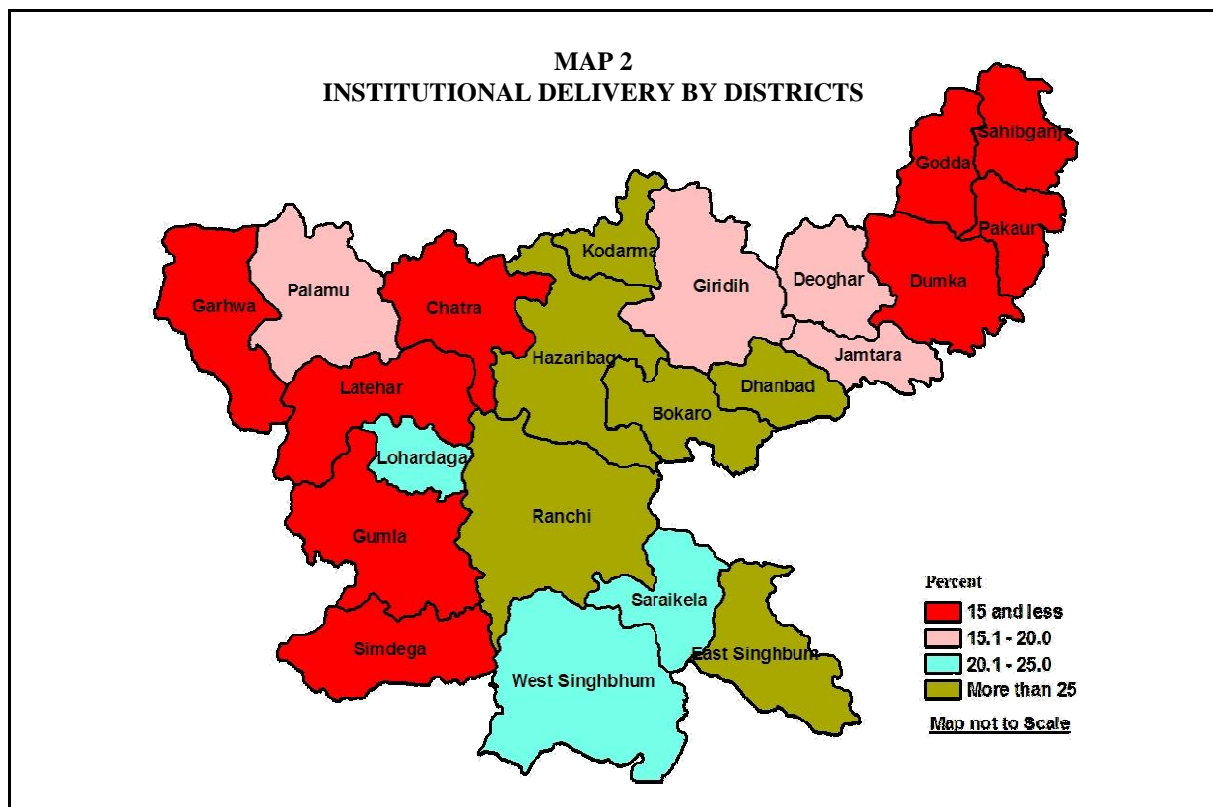

Only 9 percent of the women received full ANC in Jharkhand. The proportion of women who received full ANC is the lowest in Garhwa and Pakaur district (2.9 percent each) and is the highest in Purbi (East) Singhbhum (22.1 percent). Districtwise variation in coverage of full ANC is shown in the Map 1.

Institutional Delivery

In Jharkhand, the institutional delivery decreased from 22 percent in DLHS-2 (2002-04) to 18 percent in DLHS-3 (2007-08), presented in the Fig. 7.

Less than one-fifths of deliveries (17.7 percent) in the three year period preceding the survey which results either in still or live births were done in health facilities, either public or private (Table 4.7). The percentage of institutional delivery ranges from 6.0 percent in Sahibganj to 49.0 percent in Purbi (East) Singhbhum. District wise variation in institutional delivery is presented in the Map 2.

In Jharkhand, one-fourths of deliveries, either institutional or home deliveries were assisted by skilled persons. Little over half of the districts in Jharkhand are below the state average of safe delivery (24.9 percent). Safe delivery varies from a low of 9.0 percent in Sahibganj to the highest in Purbi (East) Singhbhum (53.7 percent). Dhanbad (43.3 percent), Kodarma districts (42.1 percent) and Hazaribagh (40.1 percent) perform relatively well in terms of safe delivery (Table 4.9). For 82 percent of women who had home deliveries, the main reasons cited for not opting institutional delivery are, it cost too much (33.6 percent), not necessary (30.9 percent) and no time to go (20.8 percent) (Table 4.10).

In Jharkhand, 2.8 percent of the deliveries which took place in institutions after January 1, 2004 have been provided with JSY financial assistance. The mean cost of delivery at government health facility is lower (Rs.1,828/-) as compared to private health facility (Rs.5,519/-). Little over two-fifths (41.4 percent) women, who had institutional delivery used an ambulance or jeep or car as the mode of transport and mean cost of transportation was Rs.445/- (Table 4.8).

Complications during Pregnancy, Delivery and Post-delivery Period

Women who either do not take ANC or take an incomplete course of ANC are exposed to the risk of maternal death. In Jharkhand, as much as 66.7 percent of women who had still /live births in the three year period preceding the survey had some complications during pregnancy. This varies from 45.9 percent in Seraikela to 80.3 percent in Garhwa. Only in 2 districts out of 22 districts in Jharkhand, namely Deoghar (46.6 percent) and Seraikela (45.9 percent) less than fifty percent of women had pregnancy complications. Among the women, who had complications during pregnancy, 32.0 percent of them sought treatment for the problem (Table 4.15).

More than four-fifths (84.0 percent) women in Jharkhand had faced at least one delivery complication. The main reason of delivery complications experienced by women who had still or live births in the three year period preceding the survey are obstructed labour (78.8 percent), premature labour (61.2 percent), prolonged labour (36.7 percent) and excessive bleeding (20.4 percent). Delivery complication is higher among women who live in urban areas (90.6 percent) as compared to their rural counterparts (83.3 percent) (Table 4.11). Delivery complications vary from a low of 65.2 percent in Deoghar to 93.3 percent in Dumka (Table 4.15).

About half (47.2 percent) of women in Jharkhand had post-delivery complications. The major problem during post delivery period were lower abdominal pain (63.3 percent), high fever (53.6 percent) followed by foul smelling vaginal discharge (29.6 percent) (Table 4.12). Post-delivery complication varies from 29.0 percent in Seraikela to 60.7 percent in Hazaribagh district. Among those who had post-delivery complications, more than one-third (36.6 percent) of women had sought treatment, 14.2 percent in Godda and 54.8 percent in Dhanbad district (Table 4.15).

CHILD HEALTH CARE AND IMMUNIZATION

To promote child survival and prevent infant mortality, NRHM envisages new born care, breastfeeding and food supplementation at the right time and a complete package of immunization for children. In Jharkhand only 29.4 percent of newborns during the three year period preceding the survey were examined within 24 hours of birth.

Newborn care within 24 hours of birth, is more common among newborns to women residing in urban areas (57.3 percent), women educated up to 10 or more years (63.1 percent), belonging to other castes (54.0 percent) and newborns to women in highest wealth index (81.2 percent) as compared to others. Among women who availed newborn care, about two-fifths of them availed newborn care from private health facility (39.0 percent) and 38.3 percent from home, 16.9 percent from a government health facility and 5.8 percent from others (Table 5.1).

More than four-fifths (84.4 percent) of children, under 3 years, born after January 1, 2004 were fed with colostrums in the breast milk and there is not much variation by residence (Table 5.2).

In Jharkhand, feeding with colostrums is widespread across all socio-economic class with at least 80 percent of children being fed with colostrums in each category.

Feeding with colostrum is near universal in Lohardaga (98.1 percent) and Garhwa (97.1 percent). There is a visible variation across districts with more than 90 percent of children being fed with colostrums in the districts of Garhwa, Godda, Dumka and almost universal in Lohardaga (98.1 percent). In the remaining district, it varies from 72.1 to 89.9 percent (Table 5.5).

Little over one-thirds of women (34.5 percent) had initiated breast milk within one hour of birth of the child. The initiation of breastfeeding within one hour of birth was least practiced among women in Sahibganj (20.0 percent) and most widely practiced in Lohardaga (57.3 percent). More than four-fifths of women (81.1 percent) had started breastfeeding within 24 hours of birth, ranging from 69.0 percent in Simdega to 93.8 percent in Godda district (Table 5.5). The proportion of women who initiated breastfeeding within one hour, within 24 hours and after 24 hours of birth are 34.5, 81.1 and 18.9 percents respectively.

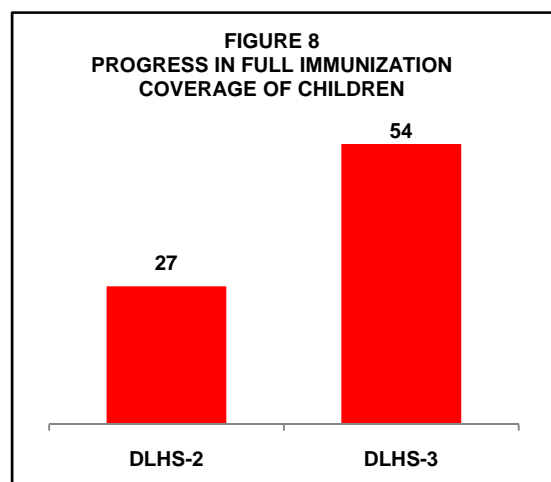

Median duration of exclusive breastfeeding of the youngest surviving child is 6.1 months (Table 5.3). For those children who had started food supplementation while still breastfeeding, median age in months at the time of other fluids, semi-solid food and solid food supplementation are 6.6 months, 8.4 months and 10.0 months respectively. The proportion of youngest surviving child who have been exclusively breastfed for 6 months is 74.9 percent (Table 5.4).

Immunization Coverage of Children Aged 12-23 Months

In DLHS-3 immunization course of children aged 12-23 months has been recorded either from vaccination card or by questioning the women in case the card was not shown. For forty-three percent of children aged 12-23 months, immunization coverage of children was recorded from the vaccination card. Little over half (54.0 percent) of children aged 12-23 months received full immunization comprising of BCG, three doses of DPT, three doses of Polio (excluding Polio 0) and measles. Nine percent of children have not received any vaccine (Table 5.6).

The coverage of full immunization increased by 27 percentage points during DLHS-2 and DLHS-3, from 27 percent in DLHS-2 to 54 percent in DLHS-3 and this is depicted in Fig.8.

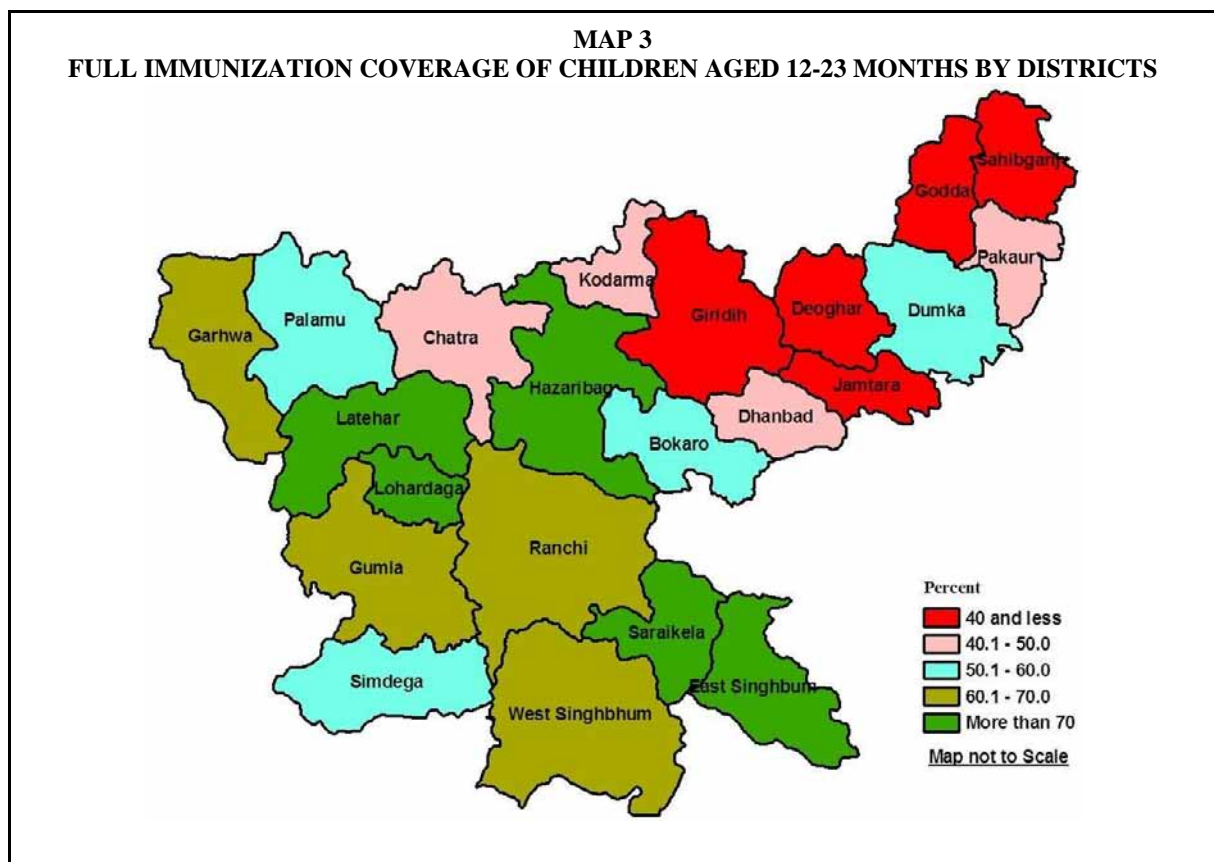

Full immunization coverage would have been well about 80 percent, if immunization against DPT did not drop down to 16.8 percent point for first (79.3 percent) to third (62.5 percent) dose and had vaccination against polio not dropped 24.7 percent point for first (89 percent) to third (64.3 percent) dose. The coverage of measles vaccine (70.6 percent) is 14.4 percent point lower than the coverage of BCG vaccine (85.0 percent). The key to improvement in full immunization coverage is to monitor drop out at any stage of vaccination

before completion of full course of immunization. The drop out rates for DPT and polio are lower in urban areas than in the rural areas. There is urban-rural gap in full vaccination by 16.5 percent points. Boys (54.6 percent) are slightly more likely than girls (53.4 percent) to be fully vaccinated. Similarly, boys are slightly more likely to receive DPT, Polio3 and measles vaccine.

Birth order and vaccination shows negative relationship, with more vaccination coverage among the first birth order. Mother’s education and wealth index has strong positive relationship with vaccination coverage. Less than half of children born to mothers who are non-literate (45.9 percent) and those in the lowest wealth index (45.0 percent) are fully vaccinated compared with children born to women with 10 or more years of education (72.2 percent) and children from households in the highest wealth index (75.5 percent) (Table 5.6).

There are considerable inter-district differentials in the coverage for different vaccinations and for children receiving full vaccinations. The percentage of children who are fully vaccinated ranges from a low of 26.5 percent in Giridih to 82.6 percent in Purbi (East) Singhbhum district. Similarly for the individual vaccines, there is inter-district differential. The coverage of BCG in all the districts of Jharkhand is above 70 percent except in Giridih district (59.2 percent). Seraikela, Lohardaga and Purbi (East) Singhbhum are the three districts in Jharkhand where the measles coverage is above 90 percent. DPT3 and Polio 3 coverage is the lowest in Giridih district (32.3 and 38.7 percent respectively). DPT3 coverage is highest in Seraikela district (89.5) while Polio 3 is highest in Lohardaga district (89.2 percent) (Table 5.7). District-wise variation in coverage of full immunization is depicted spatially in Map 3.

As regards the place of immunization, 6.4 and 8.4 percent of children received it from a Sub-Centre and Primary Health Centre (PHC) respectively and 81 percent from other government health facility (Table 5.8).

In Jharkhand, among children aged 12-35 months, about two-thirds (63.7 percent) had received at least one dose of vitamin-A and only 15 percent of children had received 3-5 doses of vitamin-A supplementation (Table 5.9). Children whose mother's education is 10 or more years (84.5 percent), from richest households (84.0 percent), children from urban residence (79.0 percent), and children from other caste groups (75.6 percent) are more likely to receive at least one dose of Vitamin-A than children from non-literate mothers (56.3 percent), poorest household (54.6 percent), rural residence (62.1 percent), and children from scheduled castes (62.1 percent) household.

In Jharkhand, the proportion of children aged 12-23 months, who received Vitamin A supplementation that is at least one dose of Vitamin-A ranges from a low of 30.3 percent in Giridih to highest in Purbi (East) Singhbhum district (89.7 percent). The districts where the coverage of Vit.-A, is below the state average of 63.7 percent are Giridih (30.3 percent), Godda (45.0 percent), Jamtara (48.2 percent) Chatra (50.1 percent), Sahibganj (50.9 percent), Kodarma (52.5 percent), Dhanbad (56.4 percent) Deoghar (57.8 percent) and Palamu (60.9 percent) (Table 5.7).

Only 11 percent of children had Hepatitis-B vaccination. In Jharkhand, children living in urban areas (25.3 percent), first and second lowest birth order (13 percent each), mother's having 10 or more years of education (28.1 percent), those belonging to other caste groups (19.8 percent) and from richest households (32.9 percent) are more likely to receive Hep-B injection than children living in rural areas (9.7 percent), 4 or more birth order (7.8 percent), non-literate mothers (7.9 percent), those belonging to scheduled tribes (9.2 percent) and those from poorest households (7.7 percent) (Table 5.9).

Diarrhoea and Acute Respiratory Infection (ARI) Management

DLHS-3 collected information on knowledge of diarrhoea and ARI management from women respondents as part of assessment of child care knowledge. Just over half (51.3 percent) of women have knowledge of diarrhoea management (Table 5.10). There is differential in knowledge of diarrhoea management among women. Women in urban areas, women with 10 or more years of education, women belonging to other castes/tribes and women in the highest wealth index are two times more likely to know about diarrhoea management than women in rural areas, non-literate women, scheduled tribes and women in the lowest wealth index.

In Jharkhand, the common type of practices, which women are aware for treating children with diarrhoea are given salt and sugar solution (54.9 percent), ORS of (45.5 percent), continue breastfeeding (15.2 percent), plenty of fluids (12.3 percent), continue normal food (12.2 percent) and about little over two-fifths (42.9 percent) are aware of other treatment (Table 5.10). Over half of children (52.2 percent) suffering from diarrhoea sought treatment and 21.4 percent of children were actually treated with ORS (Table 5.11). The percentage of children suffering from diarrhoea for whom treatment is sought rises steadily with increasing education of mother and increasing wealth index. There is a huge gap between government and private health facility as

source of treatment for treating diarrhoea. Only 20.9 percent children who had suffered from diarrhoea are treated in a government health facility while 71.0 percent of children with diarrhoea are treated in a private health facility (Table 5.11). In Godda 1.4 percent children suffered from diarrhoea in last two weeks prior to the survey and among them 64.1 percent sought treatment and in Kodarma 15.1 percent children suffered from diarrhoea and 60.6 percent of them sought treatment (Table 5.13).

Little over two-fifth of women (41.4 percent) are aware about the danger signs of ARI in Jharkhand (Table 5.12). Awareness of different danger signs of Acute Respiratory Infection (ARI) ranges from 40.7 percent to 60.6 percent. Sixty-one percent of women are aware of pain in chest and productive cough, and six out of ten women are aware of difficulty in breathing. Ten percent of children had suffered from ARI in the last two weeks prior to the survey and more than three-fourth of children (77.8 percent) suffering from ARI or fever received treatment either from a government (13.9 percent) or private health facility (77.8 percent) (Table 5.12). The prevalence of ARI among children varies from 1.3 percent in Godda to 18.1 percent in Kodarma. The percentage of children suffering from pneumonia that received treatment varies from a low of 34.5 percent in Pashchimi (West) Singhbhum district to 82 percent in Dumka (Table 5.13).

FAMILY PLANNING AND CONTRACEPTIVE USE

To achieve population stabilization and promote healthy married life, NRHM promotes contraceptive use on voluntary basis through a comprehensive package of improved accessibility and incentive programme. More than nine out of 10 ever married and currently married women are aware of any modern contraceptive. Interestingly, more than ninety percent of currently married women are aware of female sterilization for limiting and it is the most widely known contraceptive method in Jharkhand. Male sterilization (65.6 percent) is the second most widely known contraceptive method for limiting. Pill is another widely known contraceptive method for spacing with about two-third of women knowing about it (64.9 percent). Other popular modern contraceptive methods for spacing are condoms and IUD (Table 6.1). Female condom is least known method among currently married women with just 8.6 percent of them being aware of this contraceptive method. Emergency contraceptive pills, injectables, withdrawal and rhythm method were known to 14.3, 23.3, 13.1 and 23.7 percent of currently married women respectively. Similar pattern of knowledge and awareness of different contraceptives are also found in all the districts of Jharkhand (Table 6.3).

Little over two-fifth of currently married women in Jharkhand ever used any contraceptive method either modern (35.7 percent) or traditional method (9.0 percent). Female sterilization is the most popular method ever used by 25.7 percent of currently married women age 15-49 years, followed by Oral pill (7.8 percent), Rhythm method (6.4 percent) and use of condom/nirodh (4.8 percent). IUD is ever used by only 1.2 percent of women. Forty-two percent of women between 35-49 years are sterilized. More than half of currently married women in urban areas, with 10 or more years of education and women in the higher wealth index, have ever used any modern method. Female sterilization is more among urban women (38.6 percent), women belonging to other caste/tribe (37.2 percent), women with four or more living children (36.5 percent), and women belonging to highest wealth index (39.9 percent). (Table 6.4).

Contraceptive Use

The status of current contraceptive use among currently married women or their husbands shows that 35.7 percent of them are using any contraceptive method at the time of survey either one or the other modern, mostly female sterilization (25.7 percent) (Fig.9). Oral pills and IUD are currently being used by only 2.9 and 0.5 percent of currently married women. Male oriented spacing or temporary method like condom/*nirodh* is in use by 1.9 percent of the currently married women's husbands. Little over four out of every 10 women between 35-49 years are sterilized. Female sterilization is higher among urban women (38.7 percent) than women in rural areas (23.6 percent) (Table 6.5A).

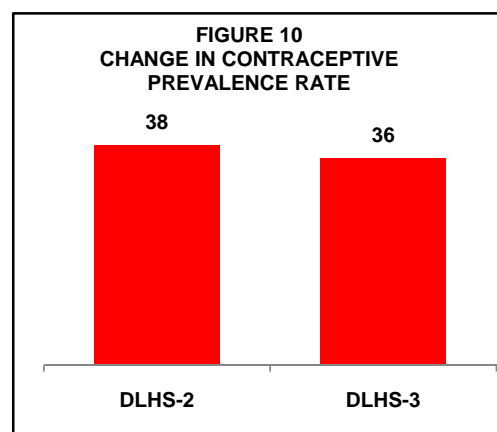

Female sterilization regardless of family size is more among currently married women who have one or more living sons compared to those with no living son. Six percent of women age 20-24 years, 20 percent of women age 25-29 years and 33.8 percent of women age 30-34 years have been found to have undergone female sterilization at the time of survey. Women in the urban areas, with more than 10 years education, women belonging to other castes/tribes and women from the richest households are more likely to have undergone female sterilization than others (Table 6.5 A). Mean age of women at sterilization is 28.0 years (Table 6.6).

Among the currently married women using IUD as a spacing method, the proportion continuing IUD for less than 2, 2-3 and more than 4 years are 31.1, 46.3, and 22.5 percent respectively. Oral pill users continuing for more than 6 months constitute 72.7 percent of the total users and 74.6 percent of condom users are continuing with the same method for longer than 6 months (Table 6.5B).

Contraceptive Prevalence Rate for Any Method

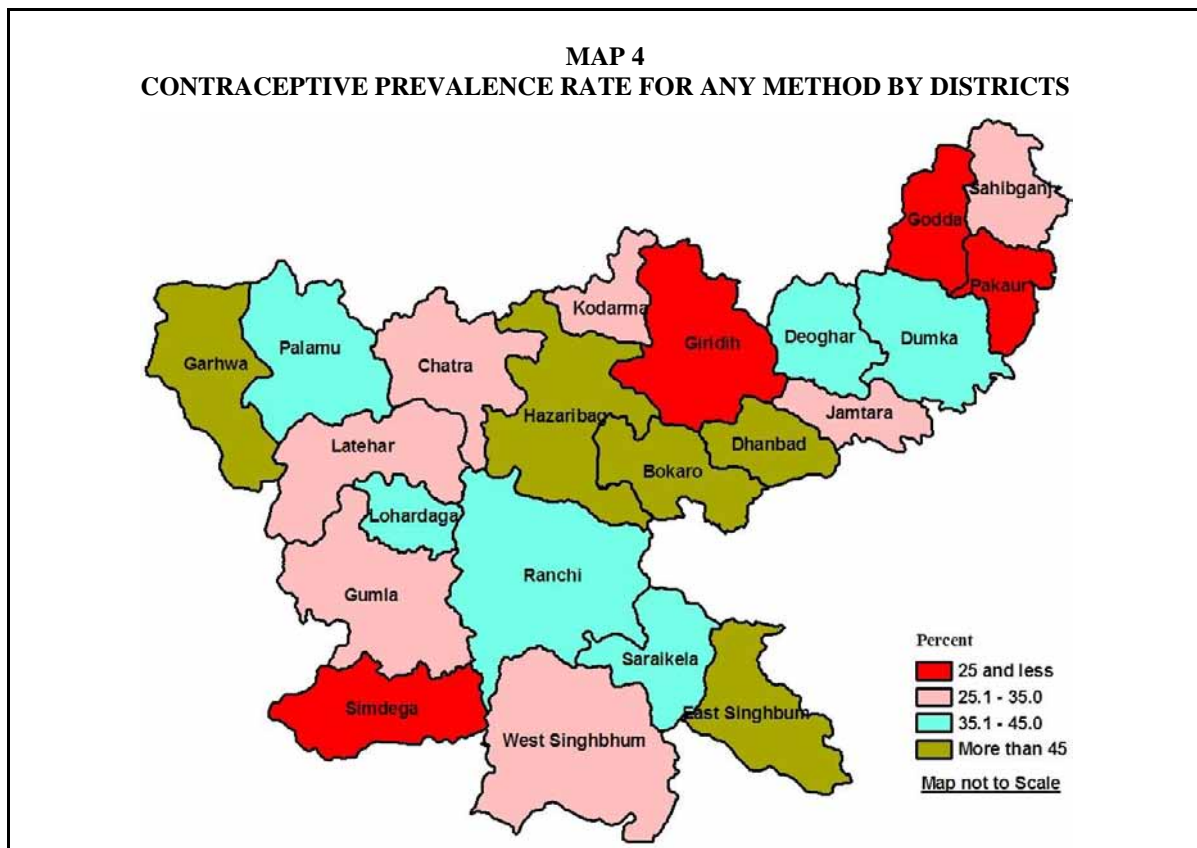

The contraceptive prevalence rate for any method decreased by 2 percentage points from 38 percent in DLHS-2 to 36 percent in DLHS-3. (Fig.10).

The prevalence of female sterilization in nine districts of Jharkhand namely Ranchi, Chatra, Purbi (East) Singhbhum, Deoghar, Palamu, Garhwa, Hazaribagh, Dhanbad and Bokaro are above the state average (25.7 percent). Female sterilization is the lowest in Pakaur

district (11.6 percent) and highest in Bokaro district (40.2 percent). In Jharkhand, the use of modern spacing methods (pill and condom) is relatively poor with only 2.9 percent and 1.9 percent respectively. Use of pill and condom varies from almost no use in Godda district (0 and 0.3 percent respectively) to the highest in Purbi (East) Singhbhum (7 and 5.7 percent respectively). (Table 6.7).

Contraceptive prevalence rate (CPR) for any method is the lowest in Pakaur district (16.5 percent) and highest in Bokaro district (53.8 percent). CPR for any method is below the state average of 35.7 percent in half of the districts in Jharkhand, ranging from 16.5-33.9 percent. Bokaro (53.8 percent) is the only district where the CPR for any method is above 50 percent. The CPR for any method is 40-50 percent in Palamu, Ranchi, Garhwa, Hazaribagh, Purbi (East) Singhbhum and Dhanbad district (Table 6.7). District-wise variation in CPR of any method is depicted spatially in Map 4.

The contrast in the source of terminal and temporary methods of contraceptives is found in the state, 71.5 percent of sterilization has been done in a government health facility and only 29.6 percent have availed of government health facility services for spacing methods (Table 6.8). In Jharkhand, over half (54.0 percent) of sterilized women and wives of sterilized men who had undergone sterilization three years preceding the survey got monetary compensation for sterilization and as much as 85.1 percent of them at the time of discharge. Receiving cash benefits for sterilization varies from a low of 18.3 percent in Giridih to highest in Simdega district (84.1 percent) (Table 6.9).

In Jharkhand 27.0, 47.1 and 29.7 percent of sterilized women, users of IUD and Pills were informed about the side effects before the adoption and 15.5, 13.1 and 10.8 percent of women using the aforesaid methods have experienced side effects or health problems. The main health problems/side effects faced by women who have undergone sterilization were body/backache (52.2 percent), weakness/inability to work (47.7 percent), abdominal pain (44.8 percent), Dizziness (24.8 percent) and fever (12.3 percent). For women using IUD, the main problems were body ache/backache (52.3 percent), irregular periods (40.5 percent), abdominal pain (34.8 percent), and weakness/inability to work (28.8 percent). The proportion of Pill users with health problems/side effects are weakness/inability to work (42.0 percent), dizziness (31.0 percent), body/back ache (21.6 percent), nausea/vomiting (21.3 percent), followed by irregular periods (16.6 percent) and abdominal pain (15.9 percent) (Table 6.10).

Among the currently married women who have discontinued contraception the main reason cited is related to fertility (65.9 percent), while 13.6 percent mentioned side effects and 20.5 percent cited other reasons. For the younger women between 15-29 years reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no living children or only one child (Table 6.11). Thirteen percent of currently married women age between 15-49 years who are not using any contraceptive method intends to adopt limiting and 2.5 percent intend for spacing method in future. Among the women who intended to adopt either limiting or spacing methods in future, 25.2 percent want to use it within 12 months and 19.6 percent want to use it after 12 months, 55.2 percent of women are still undecided about the timing for adopting any family planning method (Table 6.12).

Unmet Need for Contraception

The total unmet need for contraception either for spacing or limiting is high with 33.5 percent. The unmet need for limiting (20.8 percent) is higher than unmet need for spacing (12.7 percent). The Unmet need for contraception during DLHS-2 to DLHS-3 increased marginally by 1 percentage points, shown in the Fig. 11.

Currently married women physiologically fertile for conceiving and who want more children after two or more years are considered to have unmet need of contraceptive for spacing. Unmet need for spacing is 37.1 percent for women with one living child and 29-31 percent for women under 25 years (Table 6.15).

On the other hand, currently married women who still are physiologically fertile for conceiving but do not want more children are categorized as having unmet need for limiting and 20.8 percent women in Jharkhand have unmet need for limiting. In contrast to high unmet need for spacing among women with one living child, unmet need for limiting is high among women with higher order of living children (19.6-35.0 percent), and among women belonging to lowest

wealth index (25.2 percent). Twenty-eight percent of women age 30-39 years have unmet need for limiting.

Contraceptive Prevalence Rate and Unmet Need by Districts

Unmet need is 45.4 percent in Simdega, the highest amongst the districts and the unmet need is the lowest in Garhwa (24.3 percent). Unmet need for spacing ranges from a low of 9.3 percent in Pashchimi (West) Singhbhum to high of 17.8 percent in Pakaur district (Table 6.16). It can be also noted that unmet need for contraception is low for districts with higher contraceptive prevalence rates. District-wise distribution of contraceptive prevalence rate and unmet need for spacing and limiting are depicted in Fig.12. Similar to the state pattern, in all districts of Jharkhand, the unmet need for limiting is higher than that for spacing except for Hazaribagh district where the unmet need for spacing is slightly higher than limiting.

REPRODUCTIVE HEALTH AND AWARENESS OF RTIs/STIs AND HIV/AIDS

RTIs/STIs

An integrated agenda of NRHM is to promote awareness and knowledge on RTIs/STIs and HIV/AIDS and to make health facilities accessible for checking and treatment seeking to ensure healthy sexual life, free from fatal infection. One of the responsibilities of health personnel is to provide correct knowledge of reproductive tract infection (RTI)/sexually transmitted infection (STI), HIV/AIDS and to encourage checking and treatment.

Among ever married women age 15-49 years, 21 percent have experienced one or the other menstruation related problems, largely painful periods (74.2 percent). Irregular periods (19.0 percent), scanty bleeding (16.3 percent), blood clots/excessive bleeding (11.3 percent), frequent or short periods (8.8 percent), prolonged bleeding (8.0 percent) and absence of periods (7.4 percent) are also some major menstrual related problems reported by women in Jharkhand invariant of the background of women (Table 7.1).

In Jharkhand, less than one-fifth (17.2 percent) of ever married women have heard about RTIs/STIs and it is more often heard by women with more than 10 years education (41.2 percent), women in the highest wealth index (37.7 percent), women belonging to other caste/tribe (29.0 percent), urban women (28.6 percent) and women married to husbands with 10 or more years of education (28.0 percent) than non-literate women (11.6 percent), women in the lowest wealth index (12.1 percent), women belonging to scheduled castes (14.6 percent), women living in rural areas (15.3 percent) and those married to non-literate husbands (11.6 percent) (Table 7.2) and also shown in Fig. 13. In Jharkhand, relative/friends (73.1 percent) are the major source of RTIs/STIs information. Other popular source of RTIs/STIs information includes TV (19.7 percent), radio (12.7 percent) and husband (12.4 percent). Print media (11.1 percent) and health personnel (10.5 percent) is also a popular source of RTIs/STIs information (Table 7.2).

Among those who have heard about RTIs/STIs, 63.8, 28.1, 23.1, 21.9, 19.4 and 11.5 percent have reported unsafe sex with persons who have many partners, unsafe sex with sex worker, unsafe delivery, unsafe abortion, unsafe sex with homosexuals and unsafe IUD insertion, respectively as the reasons for transmission of RTIs/STIs. The knowledge about transmission varies by residence, educational attainment; husband's education and wealth index (Table 7.3).

One-fifth of ever married women age between 15-49 years have reported having symptoms of RTIs/STIs and 9.4 percent have experienced abnormal vaginal discharge. Among the women who had RTIs/STIs symptoms among them 7.2, 5.2, 4.1 and 2.8 percent of women have pain in lower abdomen not related to period, itching or irritation over vulva, pain during sexual act and boils/ulcers/warts around vulva. One percent reported symptoms of swelling in the groin (0.7 percent), painful blister like lesions (0.8 percent) and spotting after sexual act (1.0 percent) (Table 7.4). About two-thirds (63.0 percent) of women discussed RTIs/STIs related problems with their husbands. Among women having RTIs/STIs symptoms, only 26.3 percent of them have sought treatment, mainly from private doctors (66.9 percent) and also from a government health facility (18.3 percent) (Table 7.5).

Godda (2.8 percent) and Simdega (46.9 percent) are the two extreme districts as far as knowledge about RTIs/STIs among ever married women are concerned. In half of the districts of Jharkhand, the knowledge of RTIs/STIs is below the state average (17.2 percent). Dhanbad, Gumla, Hazaribagh and Simdega are the four districts where the knowledge of RTIs/STIs is above 30 percent ranging from 31 to 47 percent. Women who have reported having abnormal vaginal discharge and any symptom of RTIs/STIs in Godda are 4.5 and 4.1 percent respectively and in Simdega it is 8.3 and 19.3 percent respectively. Proportion of women reporting any abnormal vaginal discharge and any symptom of RTIs/STIs is lowest in Seraikela (3.2 percent) and Godda district (4.1 percent) and is the highest in Garhwa district (19.4 percent) and Ranchi (35.5 percent) respectively. More than two-fifth of women (41 percent) with symptoms of RTIs/STIs sought treatment in Hazaribagh compared to only 10 percent of women in Godda district who sought treatment for RTIs/STIs symptoms (Table 7.6).

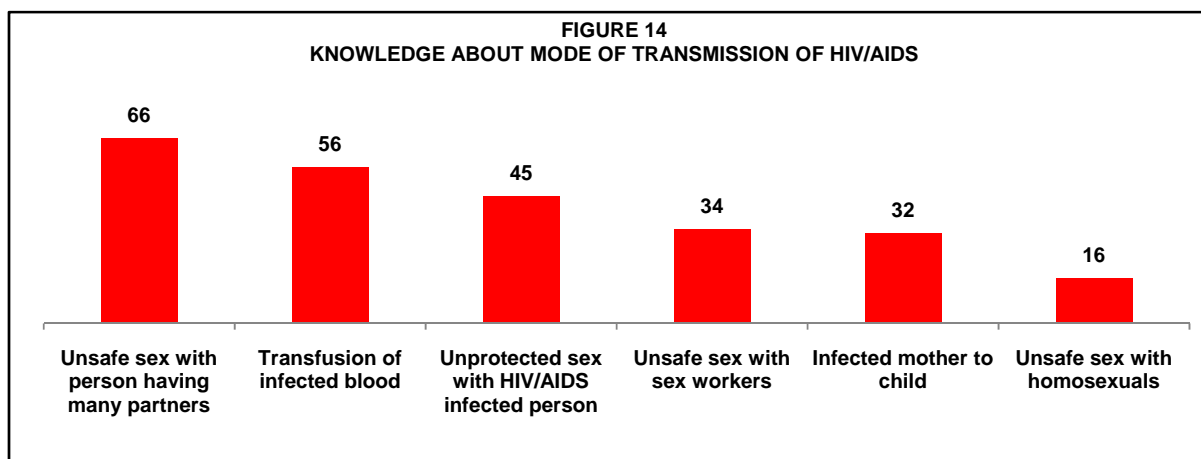

HIV/AIDS

Ever married women age 15-49 years who have heard of HIV/AIDS constitute only of 25 percent and have heard about it mostly from TV (61.4 percent), Radio (41.3 percent), relatives/friends (33.6 percent), and print media (news papers/ books/magazines/pamphlets/posters) (23.3 percent). Fourteen percent has heard about it from health personnel and 15.8 percent from their husband. School/adult education program (3.0 percent) and leaders/community meeting (4.6 percent) are not a popular source of knowledge for HIV/AIDS (Table 7.7).

The main mode of transmission of HIV/AIDS reported by women are unsafe sex with person having many partners (66.0 percent), transfusion of infected blood (55.6 percent), unprotected sex with an HIV/AIDS infected person (45.4 percent), unsafe sex with sex worker (33.6 percent), mother to child (32.1 percent), and unsafe sex with homosexuals (16.2 percent) (Table 7.8), presented in Fig.14. There is no significant variation in the knowledge regarding the mode of transmission of HIV/AIDS by background of women (Table 7.8). In Pakaur district women have least heard about HIV/AIDS (10.8 percent) and little over three-fifth of women (62.6 percent) in Purbi (East) Singhbhum have heard of HIV/AIDS (Table 7.13).

At the state level, only 32.1 percent of women have the right knowledge regarding the possibility of transmission of HIV/AIDS from mother to child. Kodarma, Lohardaga, Godda, Dhanbad, Garhwa, Dumka, Purbi (East) Singhbhum and Deoghar are the districts where women have this correct knowledge above the state average ranging from 32.6 to 62.6 percent. Only 14.6 percent of women in Pakaur district know that HIV/AIDS can be transmitted from mother to her baby (Table 7.13).

Among women who have heard of HIV/AIDS and reported that transmission of HIV/AIDS can be prevented by having sex with one partner or avoiding sex with homosexuals constitute (59.8 percent), avoiding getting infected through blood (safe blood transmission or avoiding sex with persons who inject drugs, use of tested blood, use only new/sterilized needles, avoid IV drip and avoid razors/blades) comprises of 56.1 percent and using condom correctly in each sexual act makes up 37.4 percent (Table 7.9). The right knowledge that HIV/AIDS transmission can be prevented by using condom is the lowest in Pakaur (24.2 percent) and highest in Bokaro (53.5 percent) (Table 7.13).

The most common misconception about transmission of HIV/AIDS among the ever married women is that one can get HIV/AIDS from mosquito, flea or bug bites as reported by 16.3 percent of them. This misconception is more among rural women, non-literate and women in the lowest wealth index. The proportion of women who have the misconception that HIV/AIDS can be transmitted by shaking hand, hugging, sharing clothes, sharing food and stepping on others urine/stool are 4.8, 5.2, 8.9, 11.5 and 12.2 percents respectively (Table 7.10). Regardless of background characteristics, half of ever married women (50.7 percent) know the place where HIV/AIDS can be tested. About half of the women (47.4 percent) reported HIV/AIDS test can be done in a private hospital/clinic followed by 43.1 percent reporting government hospital/dispensary as the place for testing HIV/AIDS (Table 7.11). Only 1.4 percent of ever married have undergone HIV/AIDS test, among them 60.6 percent have done it more than a year ago and 39.4 percent in the last one year period (Table 7.12). More than three-fifth of women in Gumla, Purbi (East) Singhbhum and Deoghar know the place for testing HIV/AIDS and only 25.7 percent of women in Godda district are aware of the same. The districts where the knowledge of place for HIV/AIDS test is below the state average of 50.7 percent are Godda, Pashchimi (West) Singhbhum, Jamtara, Latehar, Seraikela, Giridih, Pakaur, Palamu and Ranchi (Table 7.13).

INFERTILITY AND CHILDLESSNESS

Nine percent of ever married women aged between 15-49 years in Jharkhand have infertility problem, among them 6.8 and 2.6 percent had primary and secondary infertility respectively. About three-fourth (72.7 percent) of ever married women reported to have experienced problems in conceiving for the first time, 13.5 percent had problems in conceiving after still/live birth and 8.4 percent after undergoing induced abortion (Table 7.14). In Jharkhand, 21 percent women have menstruation related problem. More than 30 percent of women in Latehar, Chatra and Hazaribagh have menstrual problem. Over one in every ten ever married women have infertility problem including primary and secondary infertility in Gumla, Hazaribagh, Simdega, Deoghar, Pakaur, Seraikela, Dumka, Latehar and Chhatra. Infertility problem is the highest in Chhatra district (15.1 percent) and is the lowest in Pashchimi (West) Singhbhum (5.7 percent) (Table 7.17).

Among currently married women age 20-49 years, who have been married for at least five years, 4.1 percent are childless and among them 3.2 percent had problem in conceiving. Among the ever married women between 40-49 years, 2.4 percent of them are childless (Table 7.15). Among currently married women age 20-49 years, childlessness is high among the women whose age at consummation of marriage is 18 years and above (5 percent), less educated women (4.7 percent) and among those who belong to the lowest wealth index (5.1 percent) (Table 7.15). For the state as a whole, about three-fourth of ever married women (72.3 percent) who had infertility problem had sought treatment, 74.4 percent of women had sought treatment for primary infertility and 66.4 percent for secondary infertility. Women in Urban areas, women with 10 or more years of education and women in the highest wealth index are more likely to seek treatment for infertility problem (Table 7.16). Kodarma is the only district where more than 90 percent of women (91.7 percent) with infertility problem had taken treatment. Treatment seeking for infertility is the lowest among women in Palamu district (54.0 percent). Over four-fifth of women with an infertility problem had sought treatment in Pakaur, Seraikela, Purbi (East) Singhbhum, Bokaro and Dhanbad district (Table 7.17).

FAMILY LIFE EDUCATION AMONG UNMARRIED WOMEN

The objective of family life education is providing knowledge about the physiological features of women and men as they grow up and make them understand the norms of marriage and reproductive health of women. In DLHS-3 right knowledge and source of information about RTIs/STIs, HIV/AIDS, Family Planning, Family Life Education, Marriage and Reproductive Health were collected from unmarried women aged between 15-24 years.

In all 5,063 unmarried women were interviewed in Jharkhand, of which 80.0 percent were between 15-19 years and the remaining 20.0 percent were between 20-24 years. In rural areas unmarried women in the later age group is 16.3 percent against 31.4 percent in urban areas. Only one-fifth (20.6 percent) of the unmarried women in rural areas have 10 or more years of education and among urban unmarried women, 64.3 percent had more than 10 years of education. Highest proportion of unmarried women age 15-24 years belongs to Hindu religion (61.7 percent) in both rural and urban areas (59.1 and 69.6 percents respectively). In urban about three-fifth of unmarried women (58.0 percent) are from richest households (Table 8.1) and only 3.1 percent of unmarried women in rural area belong to the richest household.

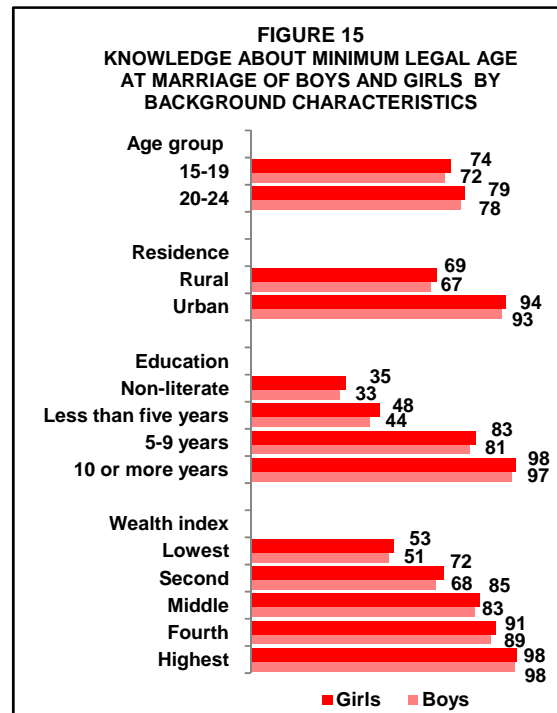

Only about three-fifths of unmarried women (58.5 percent) are aware of Family Life Education. Awareness about Family life education is below the state average among women age 15-19 years, among unmarried women who live in rural areas, have lower level of education, belonging to schedule tribes, schedule castes, and women in the lowest two wealth index. There is a significant gap (12.3 percentage point) between the level of awareness and perception of importance of Family Life Education among the unmarried women in Jharkhand. One-third (32.5 percent) of unmarried women were of the opinion that Family Life Education should be introduced by age 15-17 years. As many as 44 percent of unmarried women felt it is important to provide Family Life Education before reaching eighth standard (Table 8.2).

As regards the opinion on ideal persons who should impart Family Life Education, 71.5 percent of unmarried women felt that parents should provide them family life education, while 60.1 percent women were of the view that it should be provided by brother/sister/sister in law. Forty-

five percent had viewed that it should be provided by teacher/school/college and 25 percent women were of the view that it should be provided by friend/peers. Only 7.8 percent of unmarried women mentioned that healthcare provider/sex education experts were ideal to provide such education (Table 8.3).

Only forty-one percent of the unmarried women in Jharkhand had received Family Life Education. The main source of education is school/college (69.5 percent), followed by other sources (36.2 percent), 7.5 percent received family life education from youth club, 3 percent from a NGO programme/camp and 2 percent from government programme/camp (Table 8.4).

It has been observed that around 7 in every 10 unmarried women between 15-24 years have the knowledge of minimum legal age of marriage for boys and girls (73.1 percent for boys and 75.1 percent for girls). Ten percent reported ideal age of marriage for boys as less than 21 years while the remaining 90 percent reported more than 21 years. On the other hand, almost all women (96.6 percent) in the age group of 15-24 years reported the ideal age of marriage for girls is 18 years and above (Table 8.5).

REPRODUCTIVE HEALTH AND AWARENESS OF CONTRACEPTIVES, RTIs/STIs AND HIV/AIDS AMONG UNMARRIED WOMEN

In DLHS-3, the status of menstruation and menstruation related problems experienced by unmarried women in the three months preceding the survey were collected. Little over one in every four women (26.2 percent) had menstruation related problems during the last three months preceding the survey. Eighty-nine percent of unmarried women had painful periods, 13.8 percent had irregular periods, 8.5 percent had prolonged bleeding, 8.1 percent had blood clots/excessive bleeding and 6.9 percent had frequent or short periods. Some (1.2 to 4.9 percent) women had problems like inter-menstrual bleeding, absence of menstruation and scanty bleeding (Table 8.6).

The practices followed during menstruation period are important from the consideration of RTI and personal hygiene. Currently menstruating women were asked about the practices followed during the menstrual period. Ninety percent of the currently menstruating unmarried women used clothes, 13.0 percent use sanitary napkins and 8 percent used locally prepared napkins (Table 8.7).

Education on contraceptive means and methods is an integral component of Family Life Education besides the knowledge acquired from the exposure to mass media. It is imperative to assess the knowledge of contraceptive means and methods among the unmarried women. About three-fifth (57.3 percent) of unmarried women age 15-24 years had the knowledge of male

sterilization and 79.4 percent had knowledge of female sterilization. As regards spacing methods, 69.2 percent had knowledge of pills, 52.9 percent had knowledge of condom/*nirodh* and 35.2 percent had knowledge of IUD. About one-fifth (17.9 percent) of unmarried women had knowledge of emergency contraception and 28.9 percent have knowledge about Injectables (Table 8.8). With regard to source of availing pill and condom, about two-third (64.2 percent) of women were of the opinion that pill and condom can be obtained from government health facility and while 32.4 percent said it can be obtained from private health facility (Table 8.9).

The unmarried women were further asked about their involvement in discussion on family planning. It has been found that 23.9 percent women had ever discussed about family planning with anyone. Majority of unmarried women (82.8) percent had discussed with friends/peers, 44.9 percent had discussed with brother/sister/sister-in-law, 14 percent had discussed with parents and only 5.3 percent had discussed with teacher/school/college (Table 8.10).

Less than one-fifth (17.2 percent) of unmarried women have heard of RTIs/STIs, mostly from friends (54.0 percent), 40.7 percent from print media (newspaper/books/magazines), 39.2 percent from television, 27.2 percent heard about from radio and 22.1 percent heard of RTIs/STIs from adult education programme/school teacher. The other sources of information are health personal, cinema, partner and religious/political leader/community meetings/exhibition/*mela* (Table 8.11).

Two-third of women (65.5 percent) mentioned that RTIs/STIs can be transmitted through unsafe sex with persons who have many partners, 39.3 percent were of the opinion that it can be transmitted through unsafe sex with sex workers, 21-28 percent of the women were of the opinion that RTIs/STIs can be transmitted through unsafe sex with homosexuals, unsafe abortion and unsafe delivery, while 12.9 percent were of the opinion that it can be transmitted through unsafe IUD insertion (Table 8.12).

In Jharkhand, just over half of unmarried women (54.0 percent) are aware of HIV/AIDS and among them 62.2 percent of women have heard about HIV/AIDS from TV, 47.1 percent from print media, 40.2 percent from radio, 9.5 percent from health personnel, 8.2 from cinema and very few from adult education programme (Table 8.13). Two-third of women (66.7 percent) said that HIV/AIDS can be transmitted through transfusion of blood and three-fifth of women said that it can be transmitted thorough unsafe sex with person who has many partner. Forty-eight percent said that HIV/AIDS can be transmitted through unprotected sex with HIV/AIDS infected person while 37.8 percent said that it can be transmitted from infected mother to child. Thirty percent said that HIV/AIDS can be transmitted due to unsafe sex with sex workers and unsafe sex with homosexuals (16.7 percent) (Table 8.14).

There are many misconceptions about transmission of HIV/AIDS. Sixteen percent unmarried women were of the view that one can get HIV/AIDS by mosquito/flea or bedbugs bites, 5-12 percent were of the view that one can get HIV/AIDS by hugging, shaking hands, sharing cloths, kissing, sharing food and stepping on urine/stools of someone who has AIDS (Table 8.15). These women were further asked about how to avoid or reduce the chances of getting HIV/AIDS. Over half of unmarried women feel they could avoid by limit number of sexual partner and avoid sex with sex workers (55.3 percent) and avoid sex with person who inject drugs (52.0 percent).Thirty-six percent of women were of the view that chances of getting HIV/AIDS can be

reduced if a condom is used correctly during each sexual intercourse. Twenty-one percent of women felt that one should abstain from sex while 18 percent felt that pregnancy should be avoided when infected with HIV/AIDS (Table 8.16).

In Jharkhand 54.1 percent of women were aware of the place where HIV/AIDS could be tested. They knew that it can be done at the government hospital (89.1 percent) or private hospitals (44.3 percent) and CHC/PHC/Sub-Centre (13 percent) (Table 8.17). Fifty-three percent of unmarried women knew that it was possible to know the sex of the baby before the baby was born by medical test, 5.1 percent also knew that pregnancy cannot occur after kissing or hugging, 24.9 percent of women knew that pregnancy can occur on the very first time, a woman has intercourse and 21.5 percent were of the opinion that a woman was most likely to get pregnant if she had sexual intercourse half way between her periods (Table 8.18).

HEALTH FACILITIES - AVAILABILITY AND QUALITY

Health Facility Survey is a companion survey of the household survey in DLHS-3. It includes Sub-Centres, Primary Health Centres (PHC) and Community Health Centres (CHC) which are catering to the RCH services of sampled villages. The basic objective of facility survey is to collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructures at the level of Sub-Centre, PHC and CHC, in order to assess the adequacy of RCH services in rural areas. The average sampled rural population served per Sub-Centre, PHC and CHC in Jharkhand are 7,184, 1,27,298, and 1,20,303 respectively (Table 9.1). In all 920 villages were surveyed in DLHS-3 and the RCH services of these sampled villages were catered by 783 Sub-Centres and 184 PHCs.

Thirty percent of sampled villages have Sub-Centres within the villages, while the corresponding proportion is 11.9 and 58.3 percent in Kodarma and Gumla district respectively. More than 90 percent (91.3 percent) of sampled Sub-Centres have an ANM/Female Health Worker (FHW) in position and in all the districts of Jharkhand at least 70 percent of sampled Sub-Centres have ANM/FHW. In forty-four percent of the sampled Sub-Centres an ANM/FHW resides in Sub-Centre quarter. In Garhwa and Purbi (East) Singhbhum, though cent percent of ANMs are in position, no ANMs reside in Sub-Centre quarter. Along with these two in Jamtara and Seraikela districts no ANMs reside in Sub-Centre quarter while in Pashchimi (West) Singhbhum district all ANMs reside in Sub-Centres quarter (Table 9.2). Out of the 450 sampled Sub-Centres in public building, only 19 (4.2 percent) Sub-Centres have regular electricity. In 91 (20.2 percent) of the Sub-Centres located in government buildings, there are labour rooms and out of this only 53 (58.2 percent) of the labour rooms are currently in use. There is toilet facility in 120 (26.7 percent) of the sampled Sub-Centres located in public buildings and less than two-third (64.4 percent) of Sub-Centres house in government buildings have provision for water (Table 9.3).

In order to assess the adequacy of the equipments in the sampled Sub-Centres, the Sub-Centres having 60 percent of essential equipments for RCH services are categorized as adequately equipped, otherwise inadequately equipped. A similar categorization of Sub-Centres having adequate stock of essential drugs for RCH services is followed. In Jharkhand, 652 (83.3 percent) the sampled Sub-Centres are adequately equipped. The Sub-Centres are adequately equipped in all the 22 districts of Jharkhand ranging from 52.4 to 100 percent. In Lohardaga and Pashchimi

(West) Singhbhum district, 100 percent adequacy of equipments in the sampled Sub-Centres is observed. On the other hand, 520 (66.4 percent) of the total 783 sampled Sub-Centres have adequate stock/supply of essential drugs for RCH services. In Purbi (East) Singhbhum district, the sampled Sub-Centres have 100.0 percent adequacy of essential drugs while in Chatra and Latehar district only 25.0 percent of the samples Sub-Centres have adequacy of essential drugs for RCH services (Table 9.4). Citizen's charter is displayed in only 31.6 percent of the total 783 sampled Sub-Centres. The proportion of sampled Sub-Centres facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 81.7 and 86.7 percent respectively (Table 9.5).

In 172 PHCs (93.5 percent) of the total 184 sampled PHCs, 4-16 medical officers are serving. Lady Medical Officers are positioned in 93 (50.5 percent) of the 184 sampled PHCs. Seventy-three percent (134) PHCs of the total sampled PHCs have a pharmacist in position and only 14 PHCs (7.6 percent) have AYUSH doctors (Table 9.6).

Over four-fifth PHCs (84.2 percent) of the 184 sampled PHCs have residential quarters available for MO. Among the 184 sampled PHCs, 146 (79.4 percent) PHCs were functioning 24 hours. About ninety percent of PHCs (89.1 percent) of the sampled PHCs catering to the sample villages have at least 4 beds and such facilities are available in all the districts. Eighty-one PHCs (44.0 percent) of the total sampled PHCs have regular power supply and 165 PHCs (89.7 percent) have functional vehicles (Table 9.7).

New born care equipments are available in 58 (31.2 percent) of the sampled PHCs, 121 (65.1 percent) have functional OTs and 69 (47.3 percent) provide referral services for delivery. One hundred and forty six PHCs (79.4 percent) of the PHCs in Jharkhand have at least 60 percent of essential drugs and 164 PHCs (89.1 percent) has at least 60 percent cold storage systems. All the districts in Jharkhand have conducted at least 10 deliveries in the last one month and in the state 70 PHCs (48.0 percent) of the total sampled 184 PHCs have conducted at least 10 deliveries in the last one month (Table 9.8).

Untied funds have been utilized by 90.2 percent of PHCs (166 of the 184 sampled PHCs), 64.0-75.0 percent of PHCs in Garhwa, Palamu, Sahibganj, Dumka, Ranchi, Lohardaga, Latehar and Jamtara have utilized untied funds and in the remaining districts 100.0 percent of sampled PHCs have utilized untied funds. Excluding the PHCs in the districts of Garhwa, Palamu Sahibganj, Dumka and Jamtara, 100 percent of PHCs out of the sampled PHCs in the remaining district have received hundred percent of untied fund (Table 9.9). Rogi Kalyan Samiti (RKS) have been constituted in 86 (46.7 percent) of the sampled PHCs and Citizen's Charter displayed in 108 (58.7 percent) of the sampled PHCs.

9+	11.0	11.3	9.1
Total percent	100.0	100.0	100.0
Mean household size	5.6	5.7	5.4
Number of households**	32,261	27,508	4,753
Note: Total figure may not add to 100 percent due to 'multiple responses'.			
**Unweighted cases.			

TABLE 2.8 HOUSING CHARACTERISTICS AND ASSETS			
Percent distribution of the households by housing characteristics and selected durable goods, by residence, Jharkhand 2007-08			
Housing characteristics	Total	Residence	
		Rural	Urban
Electricity			
Having electricity connection	32.5	22.3	91.6
Source of drinking water			
Improved source	51.5	46.5	80.4
Piped water into dwelling/yard/plot	4.5	0.2	29.5
Public tap/standpipe	1.6	0.4	8.4
Tube Well or borehole	1.6	0.5	8.0
Other improved	43.8	45.3	34.6
Non Improved sources	48.5	53.5	19.6
Sanitation facility			
Improved sanitation	14.0	4.5	69.1
Flush to sewer/septic/pit	13.1	3.7	67.6
Pit with slab	0.6	0.4	1.3
Pit ventilated improved	0.2	0.1	0.2
Other	0.2	0.2	0.1
Not improved	86.0	95.5	30.9
Flush not to sewer/septic/pit/twin pit	0.1	0.0	0.4
Pit without slab	0.4	0.4	0.2
Dry toilet	0.1	0.1	0.0
No toilet/open space	85.5	95.0	30.3
Fuel used for cooking			
Liquefied Petroleum Gas (LPG)	6.3	0.6	39.0
Electricity	0.3	0.0	1.6
Kerosene	0.1	0.0	0.6
Wood	65.4	73.9	16.6
Others	27.9	25.4	42.3
Type of house			
<i>Kachha</i>	73.5	82.3	22.3
<i>Semi - pucca</i>	13.0	11.6	21.3
<i>Pucca</i>	13.5	6.0	56.4
Number of rooms			
1	16.4	17.6	9.3
2	31.4	33.0	22.1
3+	52.2	49.3	68.7
Household assets			
Fan	18.5	8.4	77.2
Radio/transistor	22.6	20.3	36.1
Sewing machine	6.5	3.1	26.0
Television	19.5	10.0	74.6
Telephone	18.5	10.9	62.7
Bicycle	66.0	65.1	71.3
Motor cycle/ scooter	11.7	6.7	40.9
Car / Jeep	1.1	0.2	6.1
Tractor	0.4	0.4	0.3
Wealth Index			
Lowest	43.4	50.5	1.9
Second	27.4	30.8	7.7
Middle	12.1	12.0	12.7
Fourth	8.3	5.3	25.9
Highest	8.8	1.4	51.8
Number of households**	32,261	27,508	4,753
**Unweighted cases.			

TABLE 2.9 HOUSING CHARACTERISTICS BY DISTRICT

Percentage of households with selected characteristics by district, Jharkhand, 2007-08

District	With electricity	With drinking water ¹	With toilet facility ²	Using Liquefied Petroleum Gas	Living in <i>pucca</i> house	Having BPL Card
Garhwa	24.8	58.5	5.9	3.7	7.7	31.9
Palamu	34.5	67.5	8.0	2.7	10.4	29.7
Chatra	22.3	44.9	7.5	1.4	8.7	41.4
Hazaribagh	59.8	32.2	25.8	10.6	30.2	27.2
Kodarma	47.8	37.9	15.0	6.7	22.7	33.4
Giridih	16.1	31.8	6.9	2.1	12.8	35.3
Deoghar	40.4	50.9	12.5	8.6	17.0	20.6
Godda	25.4	64.2	5.0	0.9	9.2	30.9
Sahibganj	11.1	51.4	9.0	2.8	7.9	19.9
Pakaur	13.5	64.1	7.0	2.0	5.3	21.7
Dumka	13.6	57.6	15.8	2.2	5.2	31.4
Dhanbad	82.5	63.7	29.1	7.8	32.4	21.8
Bokaro	64.6	62.4	36.9	23.2	41.8	17.1
Ranchi	54.0	51.0	28.6	23.6	23.5	44.2
Lohardaga	24.0	45.8	15.1	3.8	8.5	34.5
Gumla	15.0	29.7	13.0	3.5	3.3	32.3
Pashchimi (West) Singhbhum	24.2	63.4	17.1	8.2	9.7	50.9
Purbi (East) Singhbhum	68.2	71.9	53.4	33.0	38.8	29.8
Simdega	10.6	25.1	6.8	2.5	2.4	38.0
Seraikela	49.6	62.0	15.8	5.9	11.8	49.4
Latehar	11.0	49.3	7.6	1.4	4.5	44.5
Jamtara	35.2	58.2	5.7	2.2	7.4	31.2
Jharkhand	32.5	51.5	14.5	6.3	13.5	33.0

Note: ¹ Includes piped into dwelling piped to yard/plot, public tap/stand pipe/hand pump,/tube well/ bore well/well covered/spring tanker, cart with small tank and bottled water.

² Household having access to toilet facility = improved source of sanitation + flush not to sewer/septic/pit/twin pit + pit without slab + dry toilet.

TABLE 2.10 DISTANCE FROM THE NEAREST EDUCATIONAL FACILITY					
Percent distribution of sampled villages by distance from the nearest educational facility, Jharkhand, 2007-08					
Educational facility	Within village	Distance from the village			Total percent
		< 5 km	5-9 km	10+ km	
Primary school	88.3	9.6	1.8	0.3	100.0
Middle school	52.8	33.5	10.1	3.6	100.0
Secondary school	7.5	33.2	29.0	30.3	100.0
Higher secondary school	2.0	14.1	22.8	61.1	100.0
College	0.5	6.7	16.2	76.5	100.0
Madarasa	6.5	18.0	17.7	57.7	100.0
Number of villages	920				

Note: Table is based on unweighted cases.
Distance from the village is calculated for only those villages which do not have the facility within the village.

TABLE 2.11 DISTANCE FROM THE NEAREST HEALTH FACILITY					
Percent distribution of sampled villages by distance from the nearest health facility, Jharkhand, 2007-08					
Health facility	Within village	Distance from the village ¹			
		Within 3 km	Within 5 km	Within 10 km	More than 10km
Sub-Centre	29.6	60.8	77.9	94.2	5.8
Primary Health Centre	1.2	12.9	22.7	52.9	47.1
Community Health Centre	0.3	1.6	3.0	9.2	90.8
District/Govt. Hospital	0.1	1.1	2.2	8.7	91.3
Government Dispensary	0.0	2.5	4.8	13.6	86.4
Private Clinic	6.5	27.0	39.5	67.2	32.8
Private Hospital	0.1	7.6	14.3	35.5	64.5
AYUSH Health Facility	0.1	2.2	3.9	12.4	87.6

Note: ¹ Including facilities within village.

TABLE 2.12 AVAILABILITY OF FACILITY AND HEALTH PERSONNEL BY DISTRICT

Percentage of availabilities of facility and health personnel of villages by district, Jharkhand, 2007-08

District	Percentage of villages with**										
	Primary or middle school	Sub-centre	PHCs	Any government health facility ¹	Doctor	ASHA	Anganwadi workers	JSY beneficiary	VHSC	Aware of untied fund ²	Number of villages

Jharkhand (15-44) [†]	13.6	21.1	34.7	24,155

Note: Total unmet need refers to unmet for limiting and spacing.

** Unweighted cases.

¹ Unmet need for spacing includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing.

² Unmet need for limiting includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and do not want any more children but are currently not using any family planning method. Total unmet need refers to unmet for limiting and spacing.

^a Literate but did not attend school, are also included. [†] Represents figures for currently married women aged 15-44 years.

TABLE 6.16 UNMET NEED FOR FAMILY PLANNING SERVICES BY DISTRICTS

Percentage of currently married women age 15-49 years by unmet need for family planning services by districts, Jharkhand, 2007-08

District	Unmet need for FP			Number of women**

TABLE 7.17 INFERTILITY PROBLEM AND SOUGHT TREATMENT BY DISTRICTS

Percentage of ever married women aged 15-49 years who had ever menstruation problem during last three months prior to survey, ever had infertility problem and among women who had infertility problem, sought treatment for infertility, by districts, Jharkhand, 2007-08

Districts	Who have menstruation problem	Who have infertility problem ¹	Who sought treatment for infertility
Garhwa	24.3	7.5	78.0
Palamu	18.7	7.6	54.0
Chatra	30.8	15.1	60.8
Hazaribagh	33.4	10.4	72.8
Kodarma	27.6	8.8	91.7
Giridih	17.3	6.9	73.2
Deoghar	14.3	10.8	78.6
Godda	13.1	7.7	62.8
Sahibganj	19.2	8.2	72.4
Pakaur	21.9	10.8	80.4
Dumka	19.2	12.7	77.3
Dhanbad	17.3	7.2	88.6
Bokaro	24.4	8.2	85.9
Ranchi	26.0	9.6	66.6
Lohardaga	14.9	9.8	57.7
Gumla	25.1	10.3	77.4
Pashchimi (West) Singhbhum	19.8	5.7	61.9
Purbi (East) Singhbhum	15.5	7.4	82.8
Simdega	22.1	10.4	68.3
Seraikela	15.2	11.4	81.3
Latehar	30.6	13.3	57.1
Jamtara	19.0	10.0	77.4
Jharkhand (15-49)	21.3	9.4	72.3
Jharkhand (15-44)[†]	21.0	9.4	71.8

Note: Women excluding pregnant, in amenorrhea, in menopause, had hysterectomy and never menstruated women.

¹ Included both primary and secondary infertility.

[†] Represents figures for currently married women aged 15-44 years.

CHARACTERISTICS OF UNMARRIED WOMEN

TABLE 8.1 BACKGROUND CHARACTERISTICS OF UNMARRIED WOMEN

Percent distribution of unmarried women age 15-24 years, according to selected background characteristics, Jharkhand, 2007-08

Background characteristics	Total	Residence	
		Rural	Urban
Age group			
15-19	80.0	83.7	68.6
