IMPORTANT INSTRUCTIONS TO READERS:

This report is based on data collected from 21,933 households from Punjab during 2007-08. From these households, 20,898 ever-married women aged 15-49 years and 7,031 unmarried women aged 15-24 years were interviewed. Most of the tables and analysis presented in the report is based on ever-married women aged 15-49 years. However, for the purpose of comparison with DLHS-2 (2002-04) and the Fact Sheet of DLHS-3, we also provided some indicators based on currently married women aged 15-44 years in selected tables. We request the readers to keep this distinction in mind while using and comparing the DLHS-3 indicators with other surveys.

For more information, visit DLHS website: <http://www.rchiips.org>

Preface and Acknowledgements

The District Level Household and Facility Survey (DLHS-3) is a nationwide survey covering 601 districts from 34 states and union territories of India. This is the third round of the district level household survey which was conducted during November 2007 to December 2008. The survey was funded by the Union Ministry of Health and Family Welfare, United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

We are very grateful to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for the DLHS-3 Project and providing an opportunity to work closely with the health and programme officials. In particular, we would like to thank Ms. K. Sujatha Rao, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for her advice, suggestions and support. We also thank Shri Naresh Dayal, former Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for the advice and valuable support extended to the project. Our special thanks to Smt. Madhu Bala, the Additional Director General, Dr. Rattan Chand, the Chief Director and Shri. Rajesh Bhatia, the Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their active involvement and suggestions. We are also thankful to Dr. V.K. Malhotra and Shri S.K. Das, former Additional Director Generals, Shri Partha Chattopadhyay, former Chief Director, Shri K. D. Maiti, former Director and Ms. Rashmi Verma, former Deputy Director-Statistics Division, MoHFW, Government of India for the co-operation and support at various stages of this project.

We are grateful to late Dr. P. N. Mari Bhat, former Director, IIPS and Dr. S. Lahiri, former Officiating Director, IIPS for their keen interest and guidance in the initial stages of the project. We acknowledge the contributions of the Institute of Health Management Research, Jaipur the Regional Agency for the field implementation of DLHS-3 in Punjab state. The monitoring of the field survey was done independently by Population Research Centre, Himachal Pradesh University, Shimla under the guidance of National Institute of Health and Family Welfare, New Delhi.

Our thanks to the members of Technical Advisory Committee (TAC) of DLHS-3 and especially to its Chairman, Dr. P. M. Kulkarni, Professor, Jawaharlal Nehru University, New Delhi. We also thank Dr. N.K. Singh for guiding the software development and CSPro training for the project staff. We gratefully acknowledge the immense contributions of DLHS-3 project team at IIPS in developing survey instruments, training field staff, monitoring field work, data processing, preparation of district and state level fact sheets, and drafting the reports.

Finally, special thanks to all respondents who spared their valuable time and cooperated with us by providing the required information.

**DLHS-3 Coordinators
International Institute for Population Sciences**

BACKGROUND AND OBJECTIVES OF THE SURVEY

The National Rural Health Mission (2005-2012) was launched by the Government of India (GoI) in 2005-06 to provide effective health care to rural population in the country with special focus on states which have poorer health outcomes and inadequate public health infrastructure and manpower. The primary focus of the mission is to improve access of rural people, especially women and children, to equitable and affordable primary health care. The main goal of NRHM is to reduce infant mortality rate (IMR) and maternal mortality ratio (MMR) by promoting new born care, immunization, antenatal care, institutional delivery and post-partum care.

The National Rural Health Mission (NRHM) foundation is built on community involvement in drawing a village health plan under the auspices of Health & Sanitation Committee of the Panchayat, making rural primary health care services accountable to the community and giving authority to the District Health Mission for implementation of inter-sectoral District Health Plan including drinking water, sanitation, hygiene and nutrition. The interface between the community and the public health system at the village level is entrusted to a female Accredited Social Health Activist (ASHA), a health volunteer receiving performance based compensation for promotion of universal immunization, referral and escort services for reproductive & child health (RCH), construction of household toilets, and other health care delivery programmes. To promote institutional delivery, cash incentive programme under Janani Suraksha Yojana (JSY) is made an integral component of NRHM.

The third round of District Level Household and Facility Survey (DLHS-3) on Reproductive & Child Health (RCH) carried out during 2007-08 was designed to collect data at district level on various aspects of health care utilization for RCH, accessibility of health facilities, assess the effectiveness of ASHA and JSY in promoting RCH care, to assess health facility capacity and preparedness in terms of infrastructure of DLHS-3. The integration of facility survey with the household survey was done with a view to link the RCH care outcomes to health facility accessibility, availability of medical & paramedical manpower and other village infrastructures. The broad objective of DLHS-3 is to provide RCH outcome indicators at the district level in order to monitor and provide corrective measures to the NRHM. The other important objective being, to assess the contribution of decentralization of primary health care at the district level and below by way of involving village health committees under the Panchayats in implementation of health care programmes.

The main focus and objective of DLHS-3 is providing RCH indicators covering the following aspects:

- Coverage of antenatal check up and immunization services
- Institutional/safe deliveries
- JSY beneficiaries
- Contraceptive prevalence rates
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTIs/STIs and HIV/AIDS
- Family life education among unmarried adolescent girls
- Health facility and infrastructure

The District Level Household and Facility Survey, 2007-08 (DLHS-3) is the third in the series of district level household surveys. The first one was conducted in 1998-99 followed by the second in 2002-04. For all the three DLHS, the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI) designated the International Institute for Population Sciences (IIPS), Mumbai, as the Nodal Agency responsible for the development of survey design, instruments, data entry and tabulation software, training, supervision of field work, analysis and report writing. The sources of funds for DLHS-3 are the MoHFW, GoI and United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

A Technical Advisory Committee (TAC) constituted by the MoHFW, GoI guided the designing, implementation, progress, tabulation, basis of selection of RCH indicators and consistency issues.

SURVEY DESIGN, SAMPLE SIZE AND DESIGN WEIGHT

A multi-stage stratified systematic sampling design was adopted for DLHS-3. In each district, 50 primary sampling units (PSUs) which were census villages in rural areas and census enumeration blocks (CEBs) in urban areas. In rural areas, villages were selected by probability proportional to size (PPS) systematic sampling and in the second stage households were selected by systematic sampling. For urban areas first wards were selected by PPS systematic sampling, in the second stage CEBs by PPS sampling and households in the third stage by systematic sampling. The Census of India, 2001 was the sampling frame for DLHS-3. All villages and urban wards in a district were stratified by household size into three strata of less than 50, 50-300 and 300+ households, percent of SC/ST population into two strata- below and above 20 percent and implicitly by three alternating order of female literacy. These variables used for stratification are from the 2001 Census. The number of households representing a district is either 1000 or 1200 or 1500 considering the levels of immunization, antenatal check up and institutional delivery as given by DLHS-2 plus 10 percent over sampling to cushion for non-response. The PSUs are allocated to rural and urban areas of each district proportionally to the actual rural-urban population ratio and within the rural-urban domains. The PSUs are further distributed proportionately to the different sub-strata of combinations of household size, percent of SC/ST population and levels of female literacy. To make a proper rural PSU, selected villages with less than 50 households were linked with another contiguous village and selection probability is adjusted accordingly. Selected villages with more than 300 households were further divided into two or more segments and one or more segments were selected so as to have standard size PSUs. The numbers of households drawn from a PSU of districts represented by 1000, 1200 and 1500 households are 22, 27 and 33 households respectively. All ever married women age 15-49 years and adolescents age 15-24 years from the sampled households are the respondents for questions on RCH and family life education, while any adult household member is the respondent for household related questions in DLHS-3.

Sampling weight for household, ever married women and unmarried women were generated for each district. These design weights were used for computations of district level demographic and RCH indicators. The selection probabilities f_1^i , f_2^i and f_3^i at different stages of randomization pertaining to the i^{th} PSU of a district were the main inputs for generation of design weight. These selection probabilities are defined as follows:

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ rural PSU in a district}$$

$$= \frac{(n_r * H_i)}{H}$$

Where, n_r is the number of rural PSUs selected from a district, H_i refers to the number of household in the i^{th} PSU and $H = \sum H_i$, total number of rural households in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU}$$

(in case the i^{th} selected PSU is segmented)

$$= (\text{Number of } i^{\text{th}} \text{ households in the selected segment}) / (\text{number of households in the PSU})$$

The value of f_2^i is to be equal to one for un-segmented PSU.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= \frac{H_{S_i}}{HL_i}$$

Where HL_i is the number of households listed in i^{th} PSU in a district and H_s the number of households per PSU assigned for the i^{th} PSU is either 22 or 27 or 33 depending on whether a district is represented by 1000 or 1200 or 1500 households.

For urban PSUs, f_1^i is computed as the ratio of urban population of the selected PSU to the total urban population of the district.

The probability of selecting a household from the district works out as:

$$f^i = (f_1^i * f_2^i * f_3^i)$$

The non-normalized household weight for the i^{th} PSU of the district is, $w^i = \frac{1}{f^i * HR_i}$, where HR_i

is the household response rate of the i^{th} sampled PSU, assumed to be 10 % but actual response rates are used here. The normalized weight used in the generation of district indicators as

$$n_i^d = \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i, i= 1, 2, 3, \dots, 50.$$

Where n_i is the number of households interviewed in the i^{th} PSU. The weight for women is computed in the similar manner after multiplication of expression for f^i by the corresponding response rate. State weights for households, women and husbands are further derived from the district weights n_i^d for the i^{th} PSU in d^{th} district using external control so that sample results do not deviate from the corresponding information about the population.

Let, $n_s = \sum_i n_i^d$ and $N_{sc} = \sum_i N_i^d$, denote the number of households in the sample and census of a particular state, then state level households weights work out as:

$$n_i^s = n_i^d * \frac{\left(\frac{N_i^d}{N_{sc}} \right)}{\left(\frac{n_i^d}{n_s} \right)}, \text{ where } n_i^d \text{ represents household sample in } i^{\text{th}} \text{ district, } n_s \text{ is the total}$$

sample in the state. These households' weights are computed for rural-urban areas separately. Considering sample and census currently married women age between 15-49 years and married males above 15 years for specified state by districts and rural-urban residence, state level women weights are obtained for estimation of state level indicators.

IMPLEMENTATION AND QUALITY CONTROL

Actual field operation of DLHS-3 in different states and union territories were implemented by Regional Agencies (RA) selected by the MoHFW through a competitive bidding process and Institute of Health Management Research, Jaipur was designated as regional agency (RA) for implementation of DLHS-3 in Punjab. Data from the selected PSUs were collected by a team of 5 persons consisting of one Supervisor, one field Editor and three Female Investigators who are graduates at least. A minimum of two days visit to each sampled PSU is followed to ensure 100 percent coverage of selected households, ever married women and unmarried women. Independent team of Health Investigators, mostly paramedics were entrusted the work of carrying out the accompanying Facility Survey. A strict quality check protocol was put in place by the Nodal Agency by way of spot and back checks by an independent team. The Quality team comprised of two females and one male investigator and was headed by a Research Officer from the monitoring agency. One Research Officer from IIPS was stationed in each state throughout the period of the field work.

SURVEY INSTRUMENTS

The main instrument for collection of data in DLHS-3 was a set of structured questionnaires, namely, household, ever married woman, unmarried woman and village questionnaires. Sub-Centre, primary health centre (PHC), community health centre (CHC) and district hospital (DH) questionnaires were used to conduct the facility survey. All household level questionnaires were bilingual, with questions in regional and English languages.

Household Questionnaire

The household questionnaire lists all usual residents in each sample household including visitors who had stayed the night before the interview. For individual household member information on age, sex, marital status, relationship to the head of the household and education were collected. Marriages and deaths of members of household were also recorded. Efforts were made to get information about maternal deaths. Information was also collected on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, religion and caste of household head and ownership of durable goods in the household. The other information collected relates to awareness of government programmes.

Ever Married Women's Questionnaire

The respondents for the ever married women's questionnaire were ever married women age 15-49 years living in the sampled households. Details on age, age at marriage and place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Accounts of antenatal check-up, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use,

sex preference of children and fertility intentions were recorded. For the recent births, immunizations status of children was collected either from the vaccination card or by asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTIs/STIs and HIV/AIDS by source and treatment seeking behavior for RTIs/STIs.

Unmarried Women's Questionnaire

Information that was collected from unmarried women age 15-24 years (those under 18 years with consent from the parents) included knowledge of family life education, awareness about legal age at marriage, awareness about contraception, menstruation related problems, and knowledge of RTIs/STIs and HIV/AIDS by source of information.

Village Questionnaire

This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at village level. Functioning of village committees and utilization of untied funds were additionally collected from the sampled villages of DLHS.

Facility Survey Questionnaires

In the facility survey the information collected at the Sub-Centre level was availability of human resources, physical infrastructure, equipments and essential drugs and RCH service provided during the one month preceding the survey. Additional information collected at Primary Health Centre (PHC) level was availability of Lady Medical Officer, functional Labour Room, Operation Theater, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that was collected for Community health centre (CHC) included status of in-position clinical, supporting and Para-medical staffs, availability of specialists trained for NSV (Non Scalpel Vasectomy), emergency obstetric, medically terminated pregnancy (MTP), new born care, treatment of RTIs/STIs, IMNCI, ECG etc. Physical infrastructures of CHC such as, water supply, electricity, communication, waste disposal facilities, OT, Labour Room and availability of residential quarters for medical doctors were also collected in the facility survey. (The questionnaires are available at DLHS-3 website: www.rchiips.org).

HOUSEHOLD AND VILLAGE BACKGROUND

DLHS-3 Coverage and Response Rate

DLHS-3 surveyed a total of 21,933 households, 20,898 ever-married women and 7,031 unmarried women in Punjab state (Table 1.1). The response rates are 96.4, 94.8 and 91.2 percent for households, ever-married and unmarried women respectively. The lowest response rates for household, ever-married women and unmarried women are found in Ludhiana (93.7 percent), Amritsar (91 percent) and Gurdaspur (70 percent). As far as the demographic indicators of Punjab (Table 1.2) are concerned, from 2001 census it can be noted that the overall sex ratio of 876 female per 1,000 males is below the national figure of 933 and there are only two districts out of the then 17 districts where the sex ratio is above 900 and only in Hoshiarpur, it is above the national average.

Village Characteristics

As regards the accessibility of health facilities to the sampled villages, 40 percent of villages have Sub-Centres within the village itself and as many as 94.1 percent of the villages are within 5 KM. distance from a Sub-Centre (Table 2.11). In Punjab, 14.2 percent of the villages have a government dispensary within the village and 5 percent have Primary Health Centres (PHC). One noticeable feature of Punjab villages is that 25.4 percent of them have private clinics within the villages. In Punjab, 25 percent of the rural populations are treated by doctors and variation is from 4.8 percent in Amritsar to 42 percent in SAS Nagar (Mohali). Most of the villages (98 percent) have an Anganwadi worker (Table 2.12).

Household Characteristics

DLHS-3 surveyed a total of 114,767 persons (Table 2.1) from 21,933 households (Table 2.8) in Punjab covering all the twenty districts of which 70 percent are in rural areas and the remaining 30 percent in urban areas. In Punjab, 65 percent of household heads are Sikhs and 32 percent are Hindus (Table 2.7). About 9 percent of household heads are females. The average household size in the state is 5 persons and there is not much rural-urban difference. Thirty seven percent of household heads belong to scheduled castes, 17 percent to other backward classes and 46 percent to others (Table 2.7). The median age of household heads is 48 years.

Almost all households (98 Percent) in Punjab have electricity connection, 35 percent of the households have access to tap water for drinking, 60 percent of households have provision for flush toilet, 36 percent of households use LPG for cooking, 64 percent live in pucca houses and over two-thirds (68 percent) households have at least 3 rooms (Table 2.8). For the state of Punjab, 15 percent of households have BPL (below poverty line) cards and it varies from a low of 8 percent in Ludhiana to a high of 29 percent in Faridkot (Table 2.9).

Household Wealth Index

Combining household amenities, assets and durables, a wealth index is computed at the national level and divided into quintiles. Households are categorized from the poorest to the richest groups corresponding to the lowest to the highest quintiles at the national level. Based on national cut-off points, in Punjab more than half of the households are in the highest wealth index and only 3 percent households are below middle wealth index. More than three-fourths of the households (76.8 percent) in urban areas are in the highest wealth index while in rural areas it is only 47.4 percent. Percentage distribution of households by wealth index is shown in Figure 1.

Age-Sex Composition

The overall sex ratio in Punjab is 911 females per 1000 males (Table 2.1). The age-sex pyramid (Figure 2) depicts a scenario of declining fertility with a shrinking base of 27 percent of the total population below 15 years and indicates a gradually aging population with 7.5 percent of the population being above the age of 65 years. The remaining 65.5 percent of the population is in the 15-64 years age group. There are more children (27.5 percent) and persons above 65 years (7.8 percent) in rural areas than the corresponding figures of 25.8 and 6.5 percents respectively in urban areas.

The mean age at marriage of boys and girls in Punjab are 24.2 years and 21.3 years respectively. In Punjab 15.6 percent boys and 5.8 percent girls were married before the minimum legal age for marriage (Table 2.3).

Literacy by Age and Sex

Twenty four percent of the population 7 years and above are non-literate; it is 30.1 percent for females and 18.6 percent for males (Table 2.4). The gender gap in literacy rate is very narrow for the three broad age groups 7-9, 10-14 and 15-19 years (Table 2.4), also shown in Figure 3. The information on main reasons for dropping out of school was also collected in DLHS-3. For girls below 18 years as many as 26.4 percent stated that they were required for household work followed by 17.3 percent who cited disinterest in studies as the main reason for dropping out of school (Table 2.6). On the other hand, 25.8 percent boys said that they were not interested in studies, followed by 13.7 percent who stated they were required for work on family/business.

CHARACTERISTICS OF WOMEN AND FERTILITY

Age at consummation of marriage is at least 18 years for more than 83 percent of ever married sampled women between 15-49 years irrespective of residence background (Table 3.1). There are more non-literate women in rural areas (34.4 percent) than in urban areas (20.2 percent). Though non-literate husbands are much lesser compared to the women in urban areas, only 12.7 percent of husbands are non-literate. It is interesting that 34 percent of women educated at least for 10 years are married to men educated for at least 10 years, the proportion of husbands with this many years of schooling is 46.2 percent. About half of the ever married women (45.4 percent) were married for 15 years or more and the distribution of ever married women in the categories of less than 5, 5-9 and 10-14 years marital duration are uniform, 18 percent in each category.

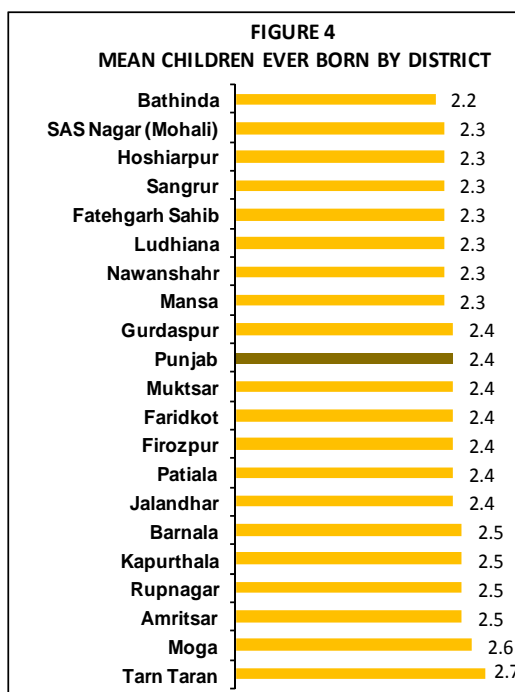

In Punjab 61.5 and 27 percent of women belong to households in the 5th and 4th wealth quintiles. The corresponding proportions of women belonging to the 5th and 4th wealth quintiles in rural areas are respectively 53.9 and 31.9 percent while in urban areas these are 80.1 and 15 percent respectively.

Mean Children Ever Born by Districts

Mean children ever born (CEB) to ever married women between 15-49 years is found to be 2.4 with marginal differential by residence background, while it is 3.1 for non-literate and 1.8 for women with at least 10 years of education. The completed fertility measured in terms of average children ever born to ever married women between 40-49 years is 3.2 (Table 3.5).

The mean children ever born to ever married women by district is shown in Figure 4 and it varies from 2.2 in Bathinda to 2.7 in Tarn Taran, while the state average is 2.4.

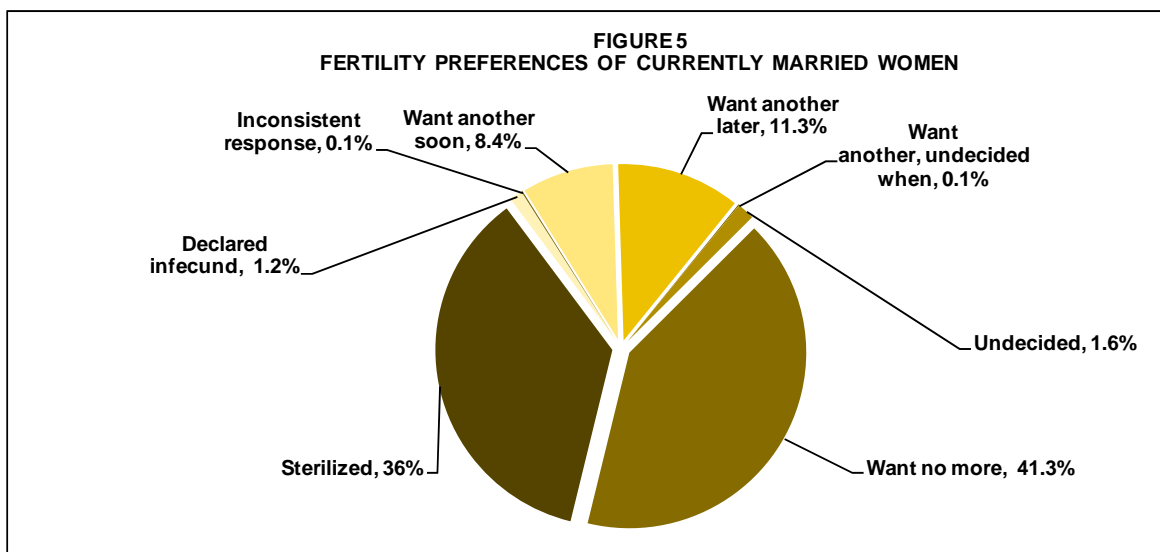

Out of the births to ever married women during the three year period preceding the survey, 24.6 percent were of third or higher order births and the corresponding figures were 45.3 and 31.3 percents respectively for non-literate and for the ever-married women with less than 5 years of schooling (Table 3.3). The births of third and higher order were more among the ever married women who live in rural areas (25.6 percent), non-literate (45.3 percent) and those belonging to scheduled caste (31.7 percent) and low to the ever-married women in urban areas (22.1 percent), educated at least up to 10 years (11.5 percent) and those belonging to other castes (21.4 percent). Births of third and higher order are highest in Tarn Taran, Amritsar and Patiala (29 percent) and lowest in Fatehgarh Sahib and Sangrur (19 percent each) (Table 3.4).

Fertility Intention and Preference of Currently Married Women

Fertility intentions of currently married women in terms of desire for additional child and timing to have the desired additional child by number of living children are given in Table 3.6. Among those with no living children, 50 percent want a child soon within the next two years and 32 percent want a child 2 or more years later. Among the currently married women with one living child, the proportion wanting an additional child soon within 2 years and after 2 years are 14 and 37 percents respectively. Most of the currently married women with two or more living children are either currently using contraceptives or want no more children.

Figure 5 depicts the fertility intention of all currently married women regardless of number of living children. As many as 41 percent of currently married women want no more children, 9 percent want a child soon, 2 percent are undecided and 36 percent have undergone sterilization.

Among the currently married women with no living children but want a child, 54 percent reported that sex of the child does not matter, 33 percent say it is up to god while 10 and 3 percent want a boy and a girl respectively. With increasing number of living children, longing for a boy among the currently married women who want an additional child, becomes more and more magnified from 38 to 88 percent for women with one and four or more living children respectively (Table 3.6).

Most of the outcomes (91 Percent) of pregnancies which occurred during the three years period preceding the survey to currently married women between 15-49 years are found to be live births. However, in Punjab, 6 percent of the pregnancies in the three years period preceding the survey resulted in spontaneous abortion and varies from 3 percent in Ludhiana to 8 percent in Sangrur (Table 3.8).

MATERNAL HEALTH CARE

Maternal health care package of antenatal care (ANC) is the main programme of NRHM to strengthen RCH care. ANC provided by a doctor, an ANM or other health professional comprises of physical checks, checking position and growth of fetus and giving Tetanus Toxoid injection (TT) at periodic intervals during the time of pregnancy. At least three check-ups are expected to complete the course of ANC to safeguard women from pregnancy related complications. Institutional delivery and post-natal care in a health facility is promoted in NRHM through the Janani Suraksha Yojana (JSY) to prevent maternal deaths.

Any ANC by Selected Background Characteristics

In Punjab 83.3 percent of the women who had their last birth during the three year period preceding the survey, had received at least one antenatal care (ANC) service. Majority of women (57.8 percent) had received the service from a private health facility and 46.3 percent women had received the service from a government health facility (Table 4.1).

Any ANC coverage by selected background characteristics are diagrammatically depicted in Figure 6. A distinctive feature is that any ANC is low 66.1 percent among non-literate as against 93.5 percent among women educated for 10 or more years; rural-urban gap is 5 percentage points, with 87.4 percent among urban residents.

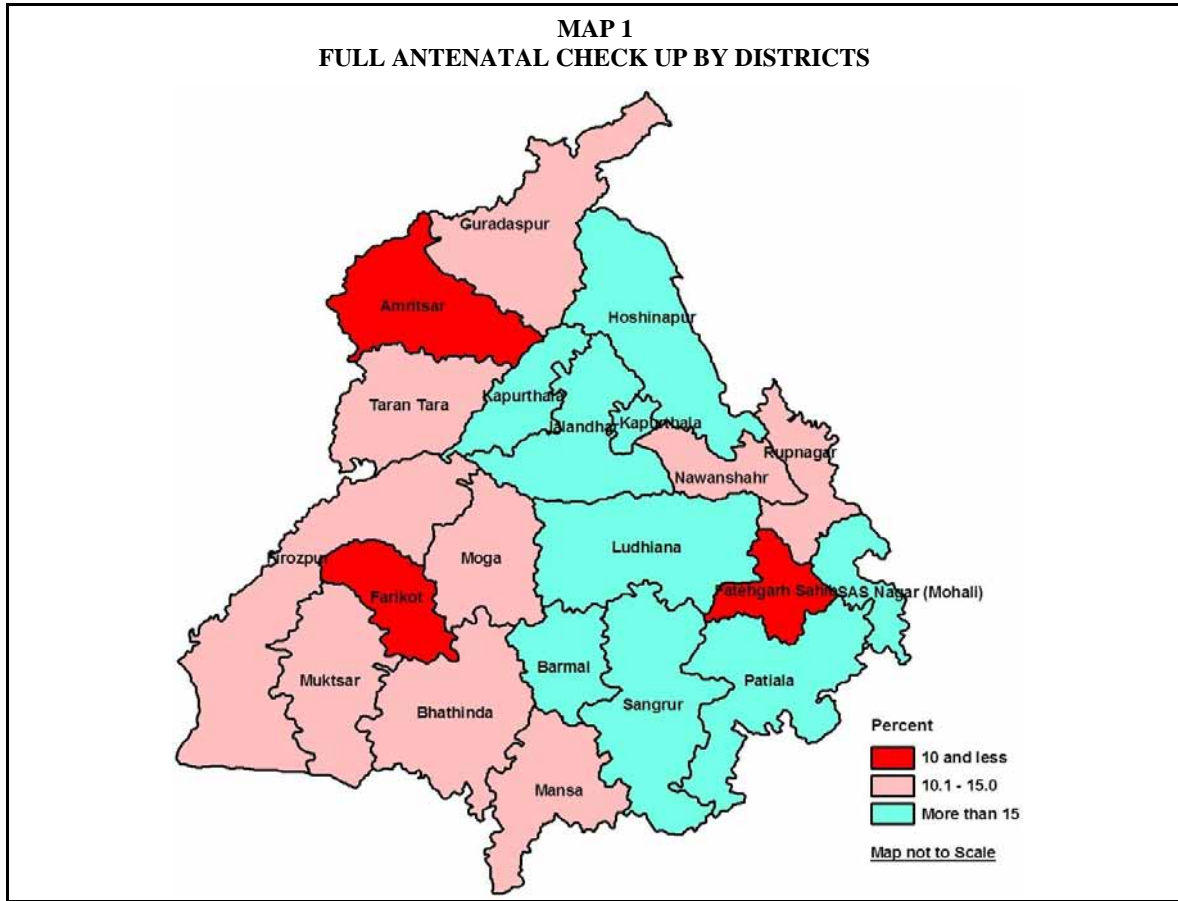

The coverage of ANC is highest in Hoshiarpur (91.7 percent) and lowest in Mansa (60.1 percent). In all districts of Punjab, women availed ANC service from either a government or private health facility or from both the facilities. For women in SAS Nagar (Mohali) district, 73.1 percent have ANC from a government facility and 28.8 percent received it from a private facility, while the corresponding government and private health facilities utilization for ANC in Firozpur are 35.1 and 74.9 percents respectively (Table 4.2).

Even when women receive ANC, all checks and examinations recommended for ANC are not availed by women during pregnancy. The proportion of women who have weight and height measured, blood pressure checked, blood and urine tested, abdomen and breast examined are 59.7, 17.7, 69.4, 75.1, 76.7, 65.4 and 26.6 percent respectively (Table 4.3). One important feature of ANC in Punjab is the sonography/ultra sound test during pregnancy. For the state as a whole, 53 percent of the total pregnancies ending in either still or live birth are subjected to a sonography/ultra sound test (Table 4.3). The corresponding proportions are higher in urban (61.9 percent), among women with 10 or more years of schooling (70.6 percent), women belonging to the highest wealth quintile (67.4 percent) and women who have one living child (63.8 percent) (Table 4.3).

The proportion of women who received at least three ANC is 64.1 percent (Table 4.5A) and 62.5 percent of women had received first ANC in the first trimester of the pregnancy. Eighty-three percent women had received at least one TT injection and only 14.3 percent of the women received full ANC in Punjab (Table 4.5B). In Punjab, the proportion of women who received full ANC is lowest in Amritsar (7.4 percent) and is highest in Hoshiapur (26.2 percent) (Table 4.6). Districtwise variation in coverage of full ANC is shown in the Map 1. The proportions of women who consumed 100 IFA tablets and received at least one TT injections are 33.4 percent & 82.5 percents respectively (Table 4.6).

**MAP 1
FULL ANTENATAL CHECK UP BY DISTRICTS**

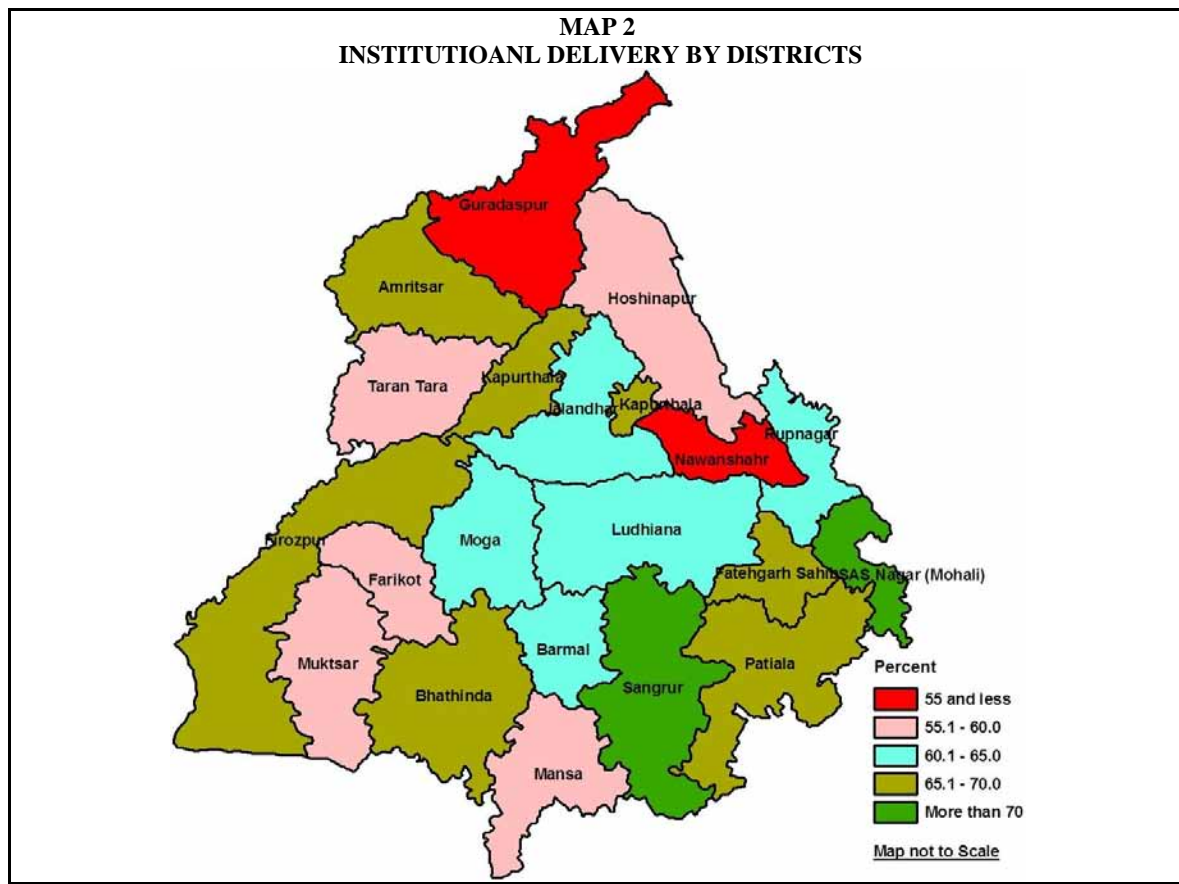

Institutional Delivery

In Punjab, the institutional delivery had increased from 41 percent in DLHS-1 (1998-99) to 49 percent in DLHS-2 (2002-04) and 63 percent in DLHS-3 (2007-08). The progress of institutional delivery in Punjab is presented in the Figure 7.

Sixty-three percent of deliveries in the three year period preceding the survey which results either in still or live births were in health facilities, either public or private (Table 4.7). The percentage of institutional delivery ranges from 49.8 percent in Gurdaspur to 73.7 percent in SAS Nagar (Mohali) (Table 4.9).

In Punjab, 13.8 percent deliveries were either institutional or home deliveries assisted by skilled person. About half of the districts in Punjab are below the state average of safe delivery. The districts are Muktsar (64.8 percent), Mansa (70.3 percent), Rupnagar (74.4 percent), Nawanshahr (71.6 percent), Ludhiana (72.6 percent), Faridkot (74.3 percent), Tarn Taran (76.6 percent) and SAS Nagar (Mohali) (75.7 percent). In the rest of the districts in Punjab safe delivery is above 75 percent. For 37 percent women who had home deliveries, the main reasons for not going institutional delivery were either the cost is too much or not necessary (36 percent each). District wise variation in institutional delivery is presented in the Map 2.

In Punjab, 2.7 percent of the deliveries which took place in institutions after January 1, 2004 have been provided with JSY financial assistance (Table 4.8). The mean cost of delivery at government health facility is lower (Rs. 3,151) compared to private health facility (Rs. 5,792). Sixty one percent women who had institutional delivery used an ambulance or jeep or car as the mode of transport and mean cost of transportation is Rs. 249 (Table 4.8).

Complications during Pregnancy, Delivery and Post-delivery Period

Women who either do not take ANC or take an incomplete course of ANC are exposed to the risk of maternal death. In Punjab, as much as 47 percent of women who had still /live births in the three years preceding the survey had some complications during pregnancy (Table 4.6). This varies from 19 percent in Tarn Taran to 69 percent in Kapurthala (Table 4.6). Only in four districts of Punjab less than thirty percent women had pregnancy complications - Amritsar (26 percent), Ferozpur (28.5 percent), Faridkot (27.2 percent) and Tarn Taran (18.9 percent). Eighty-one percent who had complications sought treatment for the problem in Punjab (Table 4.15).

About 54 percent of women in Punjab had faced at least one delivery complication (Table 4.11). The main cause of delivery complications experienced by women who had still or live births in the three year period preceding the survey are obstructed labour (66.9 Percent) and premature labour (34 Percent). Delivery complication is slightly lower among the women who live in urban areas (52.7 percent) as compared to their rural counterparts (55.1 percent). Less than 50 percent of women had some delivery complication in the districts of Gurdaspur (48 percent), Kapurthala (47 percent), Jalandhar (43 percent), Hoshiarpur (49 percent), Patiala (47 percent), Barnala (42 percent) and Muktsar (50 percent) (Table 4.15).

More than one-fifth (21.2 percent) of women in Punjab had post-delivery complications. The major problem during post delivery period is high fever (54.3 percent) followed by lower abdominal pain (50.9 percent) (Table 4.12). Among the women who had post-delivery complications, 83.9 percent had sought treatment.

CHILD HEALTH CARE AND IMMUNIZATION

To promote child survival and prevent infant mortality, NRHM envisages new born care, breastfeeding and food supplementation at the right time and a complete package of immunization for children. Seventy-nine percent of newborns during the three year period preceding the survey were examined within 24 hours of birth (Table 5.1). More newborns to women of urban residents, newborns to women educated up to 1nc or more years and belonging to other castes have received newborn care within 24 hours compared to others. More than 78 percent of the women in Punjab who had delivered in the three year period preceding the survey availed newborn check-up within 24 hours. Women who availed newborn care from a private health facility constitute 53 percent as compared to 24.6 percent from government, home (18.4 percent) and others (4.0 percent) (Table 5.1).

Ninety percent of children under 3 years of age, born after January 1, 2004 were fed with colostrum and there is not much variation across selected background characteristics of women (Table 5.2). However, there is visible variation across districts with more than 90 percent of children being fed with colostrum in the districts of Amritsar, Hoshiarpur, Nawanshahr, Rupnagar, Firozpur, Muktsar, Faridkot, Bathinda, Patiala, Tarn Taran and Mohali while in the other districts it is in the range 77-84 percent (Table 5.5).

Little more than two-fifths (44 percent) of women had initiated breast milk within one hour of birth of the child. The initiation of breastfeeding within one hour of birth is least practiced among women in Barnala (24.5 percent) and most widely practiced in Muktsar (75.9 percent). 80.6 percent women initiate breastfeeding within 24 hours of birth of their children, ranging from 65 percent in Hoshiarpur to 98.0 percent in Amritsar (Table 5.5). The proportion of women who initiated breastfeeding within one hour, within 24 hours and after 24 hours of birth to children born in the three year period preceding the survey are 44.1, 80.6 and 19.4 percent respectively.

Median duration of exclusive breastfeeding of the youngest surviving child is 3.7 months. For those children who had started food supplementation while still breastfeeding, median age in months at the time of other fluids, semi-solid food and solid food supplementation are 4.4 months, 7.2 months and 10.5 months respectively (Table 5.3). The proportion of youngest surviving who have exclusively breastfed for 6 months is 32 percent (Table 5.4).

Immunization Coverage of Children Aged 12-23 Months

In DLHS-3 immunization course of children aged 12-23 months has been recorded either from vaccination card or by questioning the mother in case the card was not shown. For 52 percent of cases immunization coverage of children was recorded from the card (Table 5.7). Eighty percent of children aged 12-23 months received full immunization comprising BCG, three doses of DPT, three doses of Polio (excluding Polio 0) and measles (Table 5.6). Only 4 percent of children have not received any kind of immunization.

Full immunization coverage would have been well above 90 percent, if immunization against DPT did not drop down from 94 to 86 percent for first and third doses and had vaccination

against polio not dropped from 96 to 87 percent for first and third dose. The key to improvement in full immunization coverage is to monitor drop out at any stage of vaccination before completion of full course of immunization. Higher proportion of male children (80 percent), births of first order (86 percent) and children born to women educated up to 10 or more years (88 percent) received full immunization compared to female children (79 percent), births of order four and above (67 percent) and non-literate women's children (66 percent) (Table 5.6). One noticeable feature is that full immunization coverage of children aged 12-23 months in rural areas is 81 percent as against 78 percent in urban areas.

The coverage of full immunization was stagnant from DLHS-1 to DLHS-2 (73 percent) but it had increased gradually to 80 percent in DLHS-3 and this is depicted in Figure 8. The coverage of full immunization of children is below 70 percent in Sangrur, Mansa, Ludhiana and Barnala, while it is more than 90 percent in Amritsar, Moga, Muktsar and Bathinda districts (Table 5.7). As regards the place of vaccination, 16 and 12 percent of children received it from a Sub-Centre and Primary Health Centre (PHC) respectively and about 66 percent from other government health facility (Table 5.8). District-wise variation in coverage of full Immunization is depicted spatially in the Map 3.

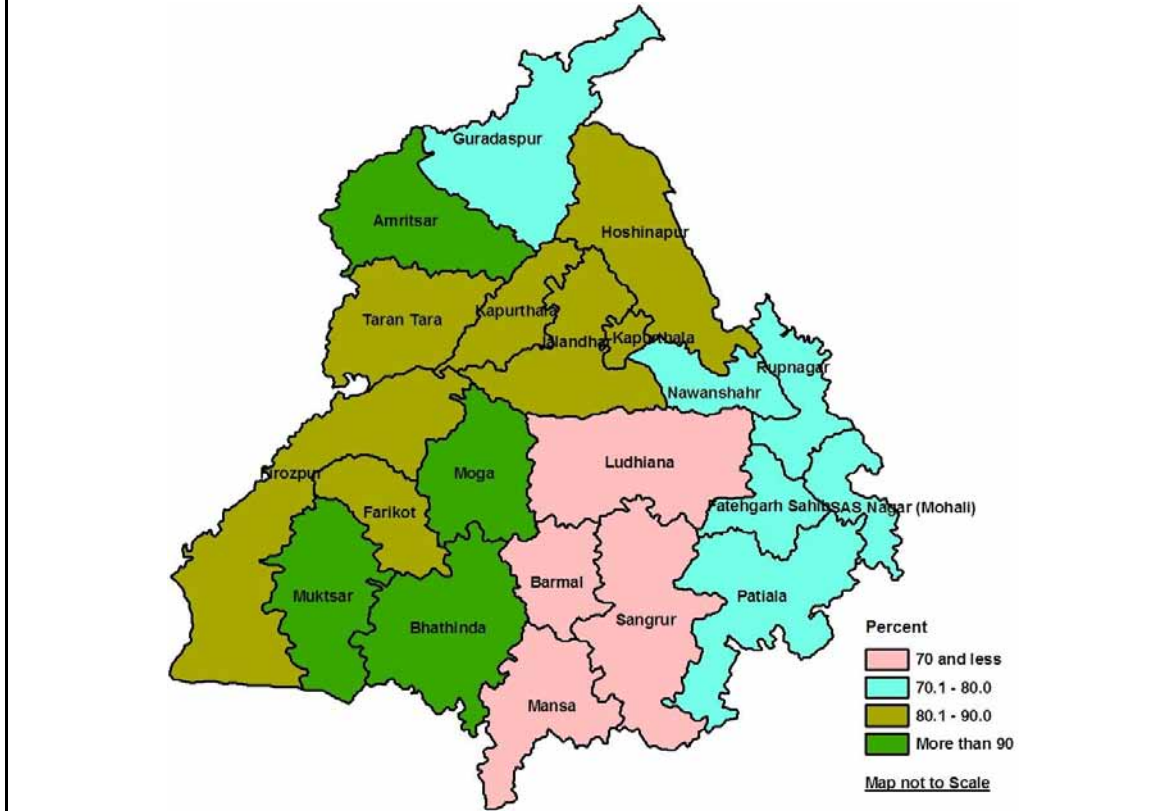

In Punjab, 68.3 and 13.3 percent children aged 12-35 months had received at least one dose and 3-5 doses of Vitamin-A supplementation respectively (Table 5.9). Rural-urban differentiation is marginal for Vitamin-A supplementation. Children from highest wealth quintile households (72 percent), other caste groups (74.1 Percent), where mother's education is 10 or more years (73.7 percent), lower birth order (71.5 percent) are more likely to receive at least one dose of Vitamin-A than children from lowest wealth quintile households (45.5 percent), scheduled tribes (61.5 percent), non-literate mothers (63.1 percent), children of four or more birth order (58.1 percent).

In Fatehgarh Sahib only 47.5 percent children aged 12-23 months received at least one dose of Vitamin-A while in Muktsar district 94.1 percent children of the same age had received Vitamin-A (Table 5.7). Amritsar and Moga are other districts of Punjab where coverage of Vitamin-A is more than 90 percent and Fatehgarh Sahib and Mansa are the districts where coverage of Vitamin-A is below 50 percent.

Forty-five percent children had Hepatitis-B vaccination. In Punjab children living in urban areas, lower birth order, mother's having 10 or more years of education, those belonging to other caste groups and from highest wealth quintile households are more likely to receive Hepatitis-B injection than children living in rural areas, four or more birth order, non-literate mothers, those belonging to scheduled tribes and from lowest wealth quintile households.

**MAP 3
FULL IMMUNIZATION COVERAGE OF CHILDREN AGED 12-23 MONTHS BY DISTRICTS**

Diarrhoea and Acute Respiratory Infection (ARI) Management

DLHS-3 collected information on knowledge of diarrhoea and ARI management from women respondents as part of assessment of child care knowledge. Nearly all women have knowledge of diarrhoea management (Table 5.10) and are aware of danger signs of ARI (Table 5.12).

The common practice followed by women for treatment of children who had diarrhoea was to give salt and sugar solution (64.1 percent), ORS (46 percent), continue normal food (33.2 percent) and plenty of fluids (25.6 percent) (Table 5.10). But in Punjab 52 percent children who suffered from diarrhoea were treated by ORS, while 88 percent of them were given some treatment or the other (Table 5.11). Fifty nine percent of children who had suffered from diarrhoea are treated in a private health facility and 20.5 percent in a government health facility (Table 5.11).

The awareness about danger signs of ARI is universal in Punjab, 21-68 percent women know that difficulty in breathing (67.5 percent), pain in chest and productive cough (50.6 percent), wheezing/whistling (31.2 percent), rapid breathing (20.8 percent) and others (63 percent) are the danger signs of ARI (Table 5.12).

Six percent children had suffered from ARI in the last two weeks prior to the survey. Ninety-three percent of the children who had suffered from ARI or fever had sought advice/treatment mostly at a private health facility (65.7 percent) (Table 5.12).

Highest proportion, 26.4 percent of last or last but one child born after January 1, 2004, in Faridkot had diarrhoea in the last two weeks prior to the survey and 95.2 percent of them have sought advice/treatment for diarrhoea (Table 5.13). In Tarn Taran about 2.9 percent of children of the same cohort had diarrhoea and 91.8 percent were provided treatment. The prevalence of ARI among children varies from 2 percent in Tarn Taran to 10.9 percent in Sangrur. The treatment seeking for ARI or fever is 100 percent in the districts of Rupnagar, Firozpur, Muktsar and Tarn Taran (Table 5.13)

FAMILY PLANNING AND CONTRACEPTIVE USE

To achieve population stabilization and promote healthy married life, NRHM promotes contraceptive use on voluntary basis through a comprehensive package of improved accessibility and incentive programme. There is near universal awareness of sterilization for limiting and IUD, Pills and Condom for spacing of children among ever married and currently married women in Punjab (Table 6.1). Female condom is least known among women with just 3.4 percent being aware of this contraceptive method. Emergency contraceptive pills, injectables, withdrawal and rhythm method were known to 53.2, 61.7, 56.3 and 71.2 percent of currently married women. Similar pattern of knowledge and awareness of different contraceptives are also found in all the districts of Punjab (Table 6.3).

Female sterilization is the predominant limiting method being used by 35.3 percent of currently married women between 15-49 years and popular male oriented spacing or temporary method like condom/nirodh is being used by 45.3 percent of husbands of currently married women. Oral pills and IUD are being ever used by 18.6 and 16.9 percent of currently married women (Table 6.4). Among the currently married women, the proportion using any modern method is 77 percent, while 82.5 percent of currently married women used either modern or traditional methods (Table 6.4).

There is marginal rural-urban difference (one percent point) in the use of any modern contraceptive (rural 76.7 percent and urban 77.8 percent). However, use of female sterilization and oral pills among rural women are more (38 and 19 percents respectively) than that among urban women (28.5 and 17.6 percents respectively) (Table 6.4).

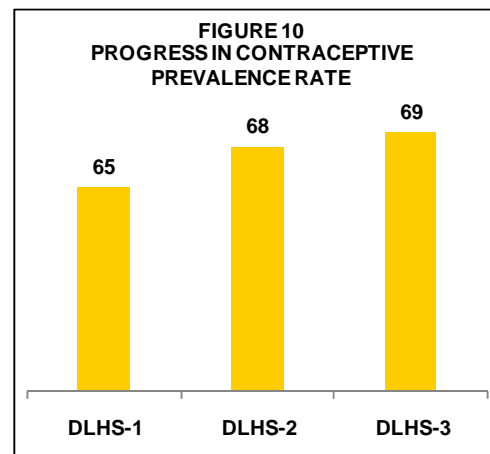

The status of current contraceptive use among currently married women or their husbands shows (Figure 9) that 63.2 percent of them are using at the time of survey, one or the other modern method, mostly female sterilization (35.3 percent). Condom/nirodh is in use by 17.8 percent of currently married women's husbands. More than 50 percent of women between 35-49 years are sterilized and female sterilizations are more among rural women (38 percent) and non-literate (54 percent) women compared to that among urban women (28.5 percent) and women educated for at least 10 years (17.9 percent) (Table 6.5A).

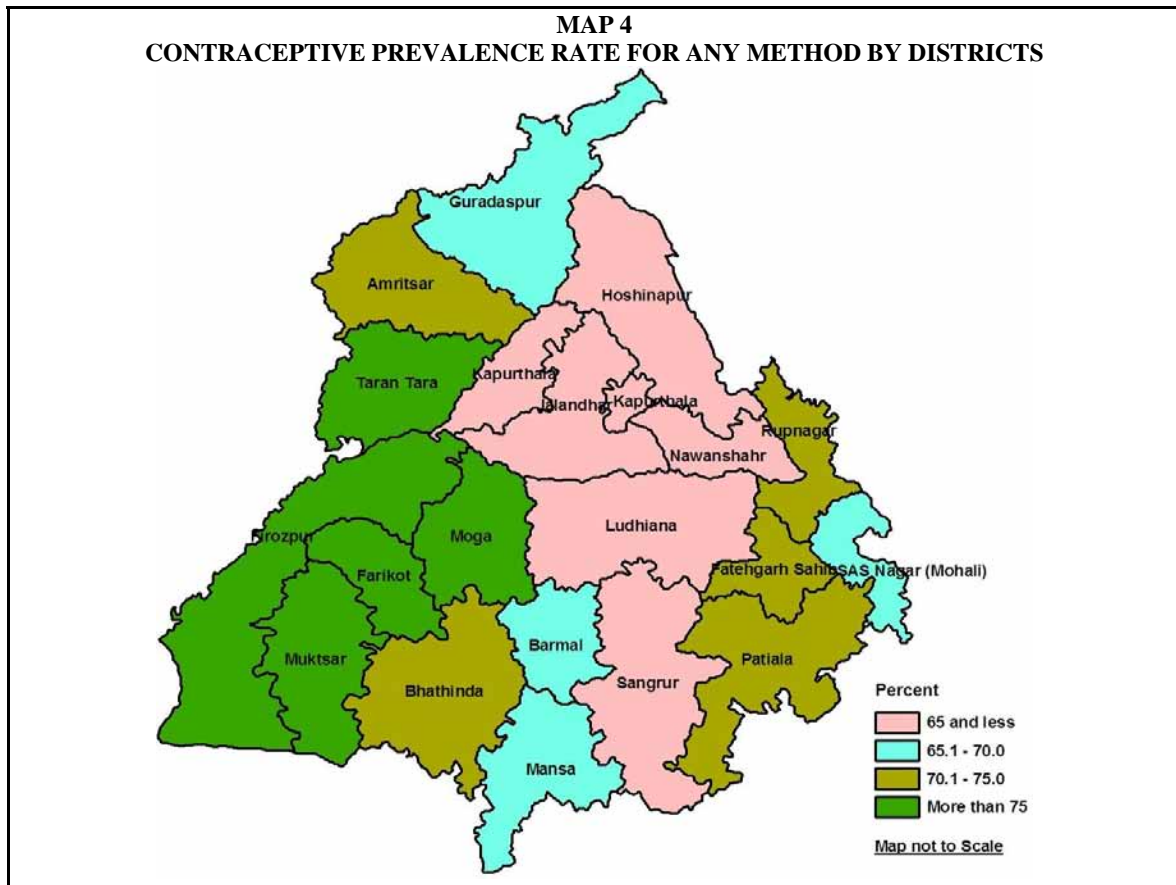

Female sterilization regardless of family size is more among currently married women who have one or more living sons compared to those with no living son. Less than 5 percent of women between 20-24 years, nearly 20 percent of women between 25-29 years and 37.2 percent of women between 30-34 years have been found to have undergone female sterilization at the time of survey (Table 6.5A). Mean age of women at sterilization is 28 years (Table 6.6). Among the currently married women using IUD as a spacing method, the proportion continuing IUD for less than 2, 2-3 and more than 4 years are respectively 38.9, 47.7 and 13.4 percent (Table 6.5B). Oral pill users continuing for more than 6 months constitute 60.8 percent of the total users and 68.7 percent of condom users are continuing with the same method for longer than 6 months (Table 6.5B).

Contraceptive Prevalence Rate for Any Method

The contraceptive prevalence rate for any method had changed marginally by 3 percent points from 65 to 68 percent from DLHS-1 to DLHS-2 and it is stagnant at 69 percent in DLHS-3 (Figure 10). Contraceptive prevalence rate (CPR) for any modern method is below 60 percent in Gurdaspur, Kapurthala, Jalandhar, Hoshiarpur, Nawanshahr, Ludhiana and Sangrur, while CPR is in the range of 60-70 percent in the districts of Amritsar, Rupnagar, Fatehgarh Sahib, Firozpur, Faridkot, Mansa, Patiala, SAS Nagar (Mohali) and Barnala (Table 6.7). In the remaining districts of Punjab CPR for any modern method is above 70 percent. The prevalence of female sterilization in the seven districts of Gurdaspur, Amritsar, Kapurthala, Jalandhar, Hoshiarpur, Nawanshahr, Ludhiana and Sangrur are below the state average (35 percent). The use of condom is the least (9.2 percent) in Mansa and highest in Amritsar (25.7 percent). District-wise variation in CPR of any methods is depicted spatially in Map 4.

**MAP 4
CONTRACEPTIVE PREVALENCE RATE FOR ANY METHOD BY DISTRICTS**

The contrast in the source of terminal and temporary methods of contraceptives is found in the state where 91.1 percent of sterilization has been done in a government health facility, whereas only 13.2 percent have availed of government health facility services for spacing methods (Table 6.8). The high and low utilization rate of government health facility for limiting and spacing methods is true for all the districts of Punjab. Nearly a quarter of sterilized women and wives of sterilized men got monetary compensation for sterilization, with variation of 16.8 percent in Ferozpur and 29.6 percent in Hoshiarpur (Table 6.9).

In Punjab 23 percent of women who had undergone sterilization three years preceding the survey had received monetary benefit and as much as 91.7 percent of them at the time of discharge (Table 6.9).

In Punjab 12.3, 23.5 and 18.9 percent of sterilized women, users of IUD and Pills were informed about the side effects before the adoption and 4.6, 3.4 and 3.5 percent of women using the aforesaid methods have experienced side effects or health problems (Table 6.10). The main health problems/side effects faced by women who have undergone sterilization are body/back ache (47.2 percent), abdominal pain (34.2 percent), weakness / inability to work (31.1 percent) followed by weight gain (13.6 percent) and excessive bleeding (11.3 percent). For women using IUD, the main problem is excessive bleeding (40.3 percent), followed by abdominal pain (22.8 percent), body/back ache (18.9 percent), weakness/inability to work (17.3 percent) and irregular period (15.1 percent). The proportions of pill users who have encountered weakness/inability to work, body/back ache, weight gain, dizziness, irregular periods and abdominal pain are 47.6, 22.6, 22.3, 21, 19.1 and 15.1 percent respectively as shown in the Table 6.10.

Among the currently married women who have discontinued contraception the main reason cited is related to fertility (53.1 percent), while 10.9 percent mentioned side effects and 36 percent cited other reasons (Table 6.11). For the younger women between 15-29 years reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no living children or only one child. Six percent of currently married women between 15-49 years not using any contraceptive intend to adopt limiting and 2.3 percent spacing method in future (Table 6.12). Among the women who intended to adopt either limiting or spacing methods in future, 31.5 percent want to use it within 12 months and 22.3 percent want to use it after 12 months. Hence, 46.2 percent women are still undecided about the timing for adopting any family planning method.

Unmet Need for Contraception

Currently married women physiologically fertile for conceiving and who want more children after two or more years are considered to have unmet need of contraceptive for spacing. Currently married women who still are physiologically fertile for conceiving and want no more children are categorized as having unmet need for limiting.

The total unmet need for contraception either for spacing or limiting is 11.4 percent. The Unmet need for contraception during DLHS-2 to DLHS-3 is almost unchanged as shown in the Figure 11. In Punjab, 3 percent of currently married women have unmet need for spacing and 8.4 percent have unmet need for limiting (Table 6.15).

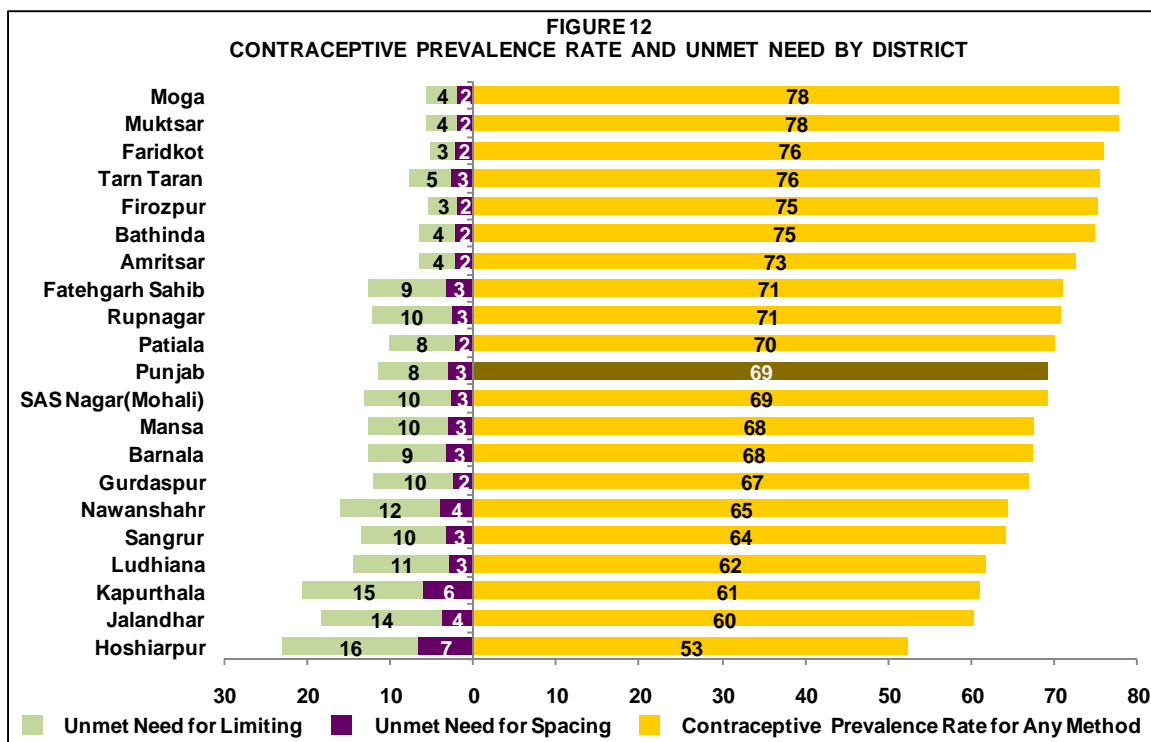

Unmet need for spacing is 12.2 percent for women with one living child and 10.5-12 percent for women under 25 years.

The unmet need of contraceptive for limiting is about 8 percent in the state, it is highest 16 percent in Hoshiarpur, 10-15 percent in Gurdaspur, Kapurthala, Jalandhar, Nawanshahr, Rupnagar, Ludhiana, Mansa, Sangrur and SAS Nagar (Mohali) (Table 6.16). Figure 12 shows the association between unmet need and contraceptive prevalence rates by districts.

Contraceptive Prevalence Rate and Unmet Need by Districts

It can be noted that unmet need for contraception is low for districts with higher contraceptive prevalence rates. Unmet need is 23 percent in Hoshiarpur, the highest amongst the districts and the unmet need is in the range of 5-7.5 percent in Amritsar, Moga, Firozpur, Muktsar, Faridkot, Bathinda and Tarn Taran. Currently married women with unmet need for spacing in Hoshiarpur and Kapurthala is around 6 percent while it is 2 percent in Gurdaspur, Amritsar, Moga, Firozpur, Faridkot, Bathinda and Patiala (Table 6.16). District-wise distribution of contraceptive prevalence rate and unmet need for spacing and limiting are depicted in Figure 12.

REPRODUCTIVE HEALTH AND AWARENESS OF RTIs/STIs AND HIV/AIDS

RTIs/STIs

An integrated agenda of NRHM is to promote awareness and knowledge on RTIs/STIs and HIV/AIDS and to make health facilities accessible for checking and treatment seeking to ensure healthy sexual life, free from fatal infection. One of the responsibilities of health personnel is to provide correct knowledge of reproductive tract infections (RTIs)/sexually transmitted infections (STIs), HIV/AIDS and to encourage checking and treatment.

Among ever married women between 15-49 years, 15.3 percent have experienced one or the other menstruation related problems, largely painful periods (77 percent) followed by blood clots/excessive bleeding (12 percent), irregular periods and absence of period (7 percent) invariant of the background of the women (Table 7.1). Fifty nine percent of ever married women have heard about RTIs/STIs and it is more often heard by urban women (67.2 percent), recently married (marital duration 0-4 months) women (65 percent), more educated women (74.8 percent) and women married to more educated husbands (68 percent) compared to rural women (56.1 percent), older marriage cohort (55.3 percent), non-literate women (45 percent) and those married to non-literate husbands (46 percent) (Table 7.2) and also shown in Figure 13. Women have heard about RTIs/STIs from multiple sources, 76.9, 51.5, 35.4, 17.5 and 12.5 percent from television, relatives/friends, print media, health personnel and husbands respectively, but only 2.4 percent from school/adult education programmes (Table 7.2). Among those who have heard about RTIs/STIs, 73.1, 27.6, 15.6, 14, 13.3 and 11.1 percent have reported unsafe sex with persons who have many partners, unsafe sex with sex worker, unsafe IUD insertion, unsafe sex with homosexuals, unsafe delivery and unsafe abortions respectively as the reasons for transmission of RTIs/STIs (Table 7.3). The knowledge about transmission varies by residence, marital duration and educational attainment in favor of urban recently married and more educated women.

About 10 percent ever married women between 15-49 years have reported having symptoms of RTIs/STIs and 5.9 percent have experienced abnormal vaginal discharge. Among the women who had RTIs/STIs symptoms among them 3, 2.4 and 1.7 percents women have itching or irritation over vulva, pain in lower abdomen not related to period and pain during sexual intercourse (Table 7.4). Many women (83.3 percent) discussed RTIs/STIs related problems with their husbands and among the women having RTIs/STIs symptoms, 67.3 percent have taken treatment, mainly from private doctors (56.1 percent) and also from a government health facility (32.7 percent) (Table 7.5).

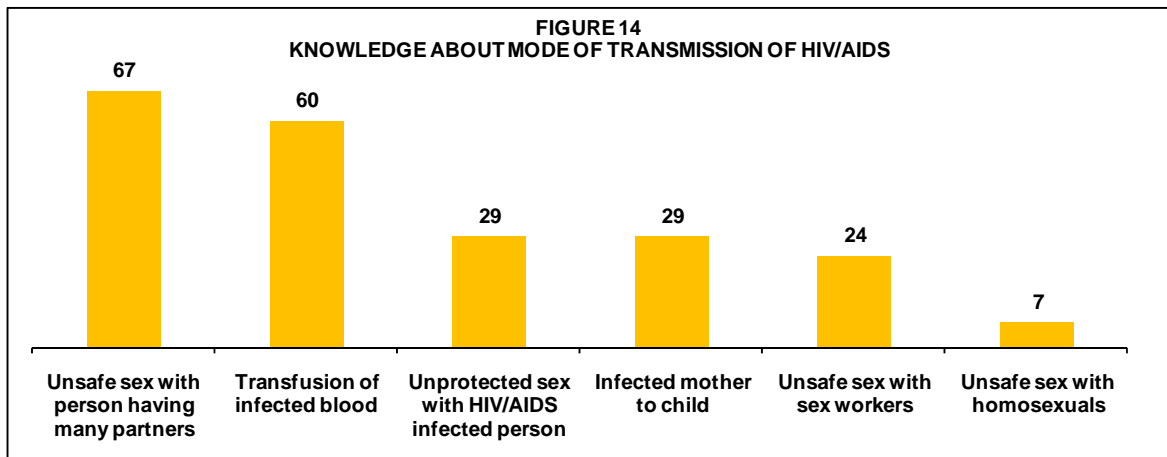

Mansa and Moga are the two extreme districts as far as ever married women who have heard about RTIs/STIs is concerned, with 35 and 84.4 percent having heard of it (Table 7.6). In the districts of Amritsar, Kapurthala, Jalandhar, Hoshiarpur, Firozpur, Muktsar, Faridkot, Bathinda, Tarn Taran and Barnala, 60-83 percent of ever married women have heard about RTIs/STIs. Women who have reported having abnormal vaginal discharge and any symptom of RTIs/STIs in Kapurthala are 8.1 and 18.7 percent respectively and in Tarn Taran are 2.3 and 2.1 percent respectively. In all districts, except in Gurdaspur, more than 50 percent of women with symptoms of RTIs/STIs have sought treatment and it is more than 90 percent in Amritsar, Moga, Firozpur, Muktsar, Faridkot and Tarn Taran (Table 7.6).

HIV/AIDS

Ever married women between 15-49 years who have heard of HIV/AIDS constitute 87.1 percent and have heard about it mostly from television (90.5 percent), print media (42.4 percent) and relatives/friends (41.3 percent). Less than 11 percent have heard about it from their husbands and 15.4 percent from health personnel (Table 7.7). Unlike in the case of RTIs/STIs, school/adult education program (4.3 percent) and leaders/community meeting (8.4 percent) are not a rich source of knowledge for HIV/AIDS (Table 7.7). The main mode of transmission of HIV/AIDS reported by women are unsafe sex with person having multiple partners (67.3 percent), transfusion of infected blood (59.6 percent), unprotected sex with an HIV/AIDS infected person (29.4 percent), mother to child (28.9 percent), unsafe sex with sex worker (24 percent) and unsafe sex with homosexuals (6.6 percent). This is presented in Figure 14. There is no significant variation in the knowledge regarding the mode of transmission of HIV/AIDS by background of women (Table 7.8). In Mansa district women have least heard about HIV/AIDS (55.8 percent) and most women (96.8 percent) in Moga have heard of HIV/AIDS.

At the state level only 28.9 percent of women have the right knowledge regarding the possibility of transmission of HIV/AIDS from mother to child and in the eight districts of Gurdaspur, Hoshiarpur, Rupnagar, Fatehgarh Sahib, Ludhiana, Firozpur, Bathinda and SAS Nagar, more than 30 percent have this correct knowledge and just 16.1 percent of women in Tarn Taran know about it (Table 7.13).

Among women who have heard of HIV/AIDS and reported that transmission of HIV/AIDS can be prevented by having sex with one partner or avoiding sex with homosexuals constitute 90.6 percent, safe blood transmission or avoiding sex with persons who inject drugs comprises of 72.2 percent and using condom correctly in each sexual act makes up 31.7 percent (Table 7.9). The right knowledge that HIV/AIDS transmission can be prevented by using condom is least in Mansa (13.8 percent) and highest in Ludhiana (45.5 percent) (Table 7.13).

The most common misconception about transmission of HIV/AIDS among the ever married women is that one can get HIV/AIDS from mosquito, flea or bug bites as reported by 14.5 percent of them (Table 7.10). This misconception is more among older, rural, non-literate and Muslim women. The proportion of women who have the misconception that HIV/AIDS can be transmitted by shaking hand, hugging, sharing clothes, sharing food and stepping on others urine/stool are 4.1, 4.8, 5.9, 8.3 and 7.6 percents respectively. Regardless of background characteristics, more than 86.4 percent of ever married women know the place where HIV/AIDS can be tested (Table 7.11). Almost every woman in Barnala, Kapurthala, Jalandhar, Hoshiarpur know the place for testing and only 82 percent of women in Bathinda are aware of the same (table 7.13). Most women (56.7 percent) reported HIV/AIDS test can be done in a government hospital/dispensary followed by 36.6 percent reporting private hospital/clinic as the place for testing HIV/AIDS (Table 7.11). Just about 4.3 percent of ever married have undergone HIV/AIDS test, among them 60.6 percent have done it more than a year ago and 39.4 percent in the last one year period (Table 7.12).

INFERTILITY AND CHILDLESSNESS

Women who had primary and secondary infertility constitute 7 and 1.8 percent respectively of ever married women between 15-49 years (Table 7.14). A sizeable 79.5 percent of ever married women reported to have experienced problems in conceiving for the first time, 11.7 percent had problems conceiving after still/live birth and 8.2 percent after undergoing induced abortion (Table 7.14). More than 20 percent of women in Kapurthala, Jalandhar and Hoshiarpur have menstruation problem, while more than 10 percent of ever married women in Amritsar, Kapurthala, Hoshiarpur, Firozpur, Faridkot and Barnala have infertility problem including primary and secondary infertility (Table 7.17).

About 2 percent of women between 20-49 years, who have been married for at least five years, are childless and the prevalence of childlessness among ever married women is invariant of their background characteristics. Among the ever married women between 40-49 years, 1.4 percent of

them are childless. Among currently married women between 20-49 years who have been married for five years two percent were childless and 1.6 percent had problem in conceiving. Among 40-49 years, 1.4 percent were childless and 1.3 percent had problem in conceiving (Table 7.15).

Ever married women who have primary infertility problem among them 95.9 percent of them have taken treatment and ever married women who have secondary infertility problem among them 92.1 percent have taken treatment (Table 7.16). Treatment seeking behavior does not vary much by background characteristics of women. Every woman who has an infertility problem has taken treatment in Moga, Firozpur and Faridkot (Table 7.17).

FAMILY LIFE EDUCATION AMONG UNMARRIED WOMEN

The objective of family life education is providing knowledge about the physiological features of women as they grow up and make them understand the norms of marriage and reproductive health of women. In DLHS-3 right knowledge and source of information about RTIs/STIs, HIV/AIDS, family planning, family life education, marriage and reproductive health were collected from unmarried women aged between 15-24 years.

In all 7,031 unmarried women were interviewed in Punjab, of which two-third (67.4 percent) were between 15-19 years and the remaining one-third (32.6 percent) were between 20-24 years. In rural areas unmarried women in the later age group is 30.2 percent against 38.4 percent in urban areas. More than half (57.1 percent) of the unmarried women had 10 or more years of education and this proportion is 69.2 percent among urban unmarried women (Table 8.1). Around three-fourth (75.4 percent) of the rural unmarried women between 15–24 years were Sikhs while more than half (53.5 percent) of urban unmarried women were Hindus.

Eighty-five percent of women were aware of family life education and awareness among non-literate women and Muslim women is below the overall level of awareness (Table 8.2). There is marginal gap between the level of awareness and perception of importance of family life education among the unmarried women in Punjab by selected background characteristics. Significant proportions (46.9 percent) of women were of the opinion that family life education should be given by age 15-17 years. As many as 43.7 percent of unmarried women felt it is important to provide family life

education after reaching tenth standard (Table 8.2).

As regards the opinion on ideal persons who should impart family life education, 86.5 percent of unmarried women felt that parents should provide them family life education, while 67.6 percent women were of the view that it should be provided by teacher/school/college (Table 8.3).

Another 54.9 percent women said that it should be provided by brother or sister or sister-in-law. Only 4.2 percent of unmarried women mentioned that healthcare provider/sex education experts were ideal to provide such education. More than half (54.2 percent) of the unmarried women in Punjab had received family life education. The main source of education is school/college (87 percent), followed by other sources (21.3 percent) and 6.1 percent had received family life education from a Government programme/camp (Table 8.4).

It has been observed that around 96 percent of unmarried women aged between 15-24 years have the knowledge of minimum legal age of marriage for boys and girls. Around six percent reported ideal age of marriage for boys as less than 20 years while the remaining 94 percent reported more than 20 years. On the other hand, almost all women in the age group of 15-24 years reported the ideal age of marriage for girls is 18 years and above (Table 8.5).

REPRODUCTIVE HEALTH AND AWARENESS OF CONTRACEPTIVES, RTIs/STIs AND HIV/AIDS AMONG UNMARRIED WOMEN

In DLHS-3, the status of menstruation and menstruation related problems experienced by unmarried women in the three months preceding the survey were collected. More than one out of every five women (22 percent) had menstruation related problems during the last three months preceding the survey (Table 8.6). More than nine out of every ten (91.4 percent) unmarried women had painful periods while around seven percent had irregular periods. Some women had problems like frequent or short periods. Not many women had problems of prolonged/scanty bleeding during menstruation (Table 8.6).

The practices followed during menstruation period are important from the consideration of RTI and personal hygiene. Currently menstruating women were asked about the practices followed during the menstrual period. Three-fourth (75.2 percent) of the currently menstruating unmarried women used clothes while 16.5 percent used locally prepared napkins and another 30 percent used sanitary napkins (Table 8.7).

Education on contraceptive means and methods is an integral component of family life education besides the knowledge acquired from the exposure to mass media. It is imperative to assess the knowledge of contraceptive means and methods among the unmarried women. About 73.8 percent of unmarried women between 15–24 years had the knowledge of male sterilization while 93.4 percent had knowledge of female sterilization (Table 8.8). As regards spacing methods, 85.1 percent had knowledge of pills, 83.7 percent had knowledge of condom/Nirodh while 68.3 percent had knowledge of IUD. It is noteworthy that one-third of unmarried women had knowledge of emergency contraception and injectables (31.9 to 37.7 percent respectively) (Table 8.8). Information was sought from the sampled unmarried women about the places from where one can get pill and condom. Around three-fourth (73.4 percent) women were of the opinion that pill and condom can be obtained from government health facilities while another 57.7 percent said it can be had from private sources too (Table 8.9).

The unmarried women were further asked about their involvement in discussion on family planning. It has been found that 18.4 percent women had ever discussed about family planning with anyone. About 32.2 percent had discussed with parents, 56.7 percent had discussed with brother/sister/sister-in-law, and 20.7 percent had discussed with teacher/school/college (Table 8.10).

About half (46.3 percent) of unmarried women had heard of RTI and STI (Table 8.11). More than 80 percent knew about RTI and STI from television, more than half of the unmarried women (55.9 percent) knew about RTIs/STIs from print media (newspaper/books/magazines), 38.2 percent come to know from relatives and friend, 28.1 percent from adult education programme/school teacher and 10.6 percent from health personnel (Table 8.11).

More than three-fourth (78.2 percent) unmarried women mentioned that RTIs/STIs can be transmitted through unsafe sex with persons who have many partners; around one-fourth were of the opinion that it can be transmitted through unsafe sex with homosexuals. More than 10 percent of unmarried women were of the view that RTIs/STIs can be transmitted through unsafe delivery or unsafe abortions or unsafe IUD insertion (Table 8.12).

More than 90 percent unmarried women were aware of HIV/AIDS. Around two-thirds (64 percent) of women knew about HIV/AIDS from newspaper books/magazines, and 94.2 percent from television. For some unmarried women, radio, doctor and Health Worker (Health personnel) were the source of HIV/AIDS knowledge (Table 8.13). Among them more than two third (66.4 percent) said that HIV/AIDS can be transmitted through unsafe sex with persons who have many partners and by transfusion of blood (69.4 percent). Forty-five percent were of the opinion that it can be transmitted from infected mother to child while more than one-third women were of the opinion that it can be transmitted by unprotected sex with HIV/AIDS affected persons. Around one-fourth (24.4 percent) women are of the view that HIV/AIDS can also be transmitted due to unsafe sex with sex workers (Table 8.14).

There are many misconceptions about transmission of HIV/AIDS. Around four percent unmarried women were of the view that one can get HIV/AIDS by stepping on urine/stools of someone who has AIDS, by sharing food with them or by kissing them. Some women (2.3-10.9 percent) were of the opinion that one can get HIV/AIDS by hugging; sharing of clothes and mosquito/flea or bed bugs bites (Table 8.15). These women were further asked about how to avoid or reduce the chances of getting HIV/AIDS. Around 84 percent feel that it can be avoided by limiting sex with one partner/staying faithful to one partner (Table 8.16). Three-fourth women were of the view that chances of getting HIV/AIDS can be avoided by use of tested blood. One-third (32.6 percent) felt that it can be avoided if a condom is used correctly during each sexual intercourse. One-fifths (20.7 percent) of women felt that one should avoid pregnancy when having HIV/AIDS (Table 8.16).

Around 89 percent women were aware of the place where HIV/AIDS could be tested (Table 8.17). They knew that it can be done at the government/private hospitals, CHC/PHC/Sub-Centre and VCTC/ICTC clinics. In Punjab about seven in ten (68.9 percent) unmarried women knew that it was possible to know the sex of the baby before the baby was born by a medical test. Majority (95.8 percent) of unmarried women knew that pregnancy cannot occur after kissing or hugging. While more than one-thirds (32.2 percent) women knew that it can occur when a woman has intercourse. Less than one-fourth (23.5 percent) women were of the opinion that a woman was most likely to get pregnant if she had sexual intercourse half way between her periods (Table 8.18).

HEALTH FACILITIES - AVAILABILITY AND QUALITY

Health Facility Survey is a companion survey of the household survey in DLHS-3. It includes Sub-Centers, Primary Health Centers (PHC) and Community Health Centers (CHC) which are catering to the RCH services of sampled villages. The basic objective of facility survey is to

collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructures at the level of Sub-Centre, PHC and CHC, in order to assess the adequacy of RCH services in rural areas. The average sampled rural population served per Sub-Centre, PHC and CHC in Punjab are 6,185; 29,157 and 1,27,033 respectively (Table 9.1). In all 697 villages were surveyed in DLHS-3 and the RCH services of these sampled villages were catered by 595 Sub-Centres, 134 PHCs and 155 CHCs.

Forty percent of sampled villages have Sub-Centre within the villages, while the corresponding proportion is 20.5 and 77.1 percent in Rupnagar and Barnala respectively (Table 9.2). About 80 percent of sampled Sub-Centres have an ANM/Female Health Worker (FHW) in position and in most of the districts more than 60 percent of sampled Sub-Centres have an ANM/FHW except in Patiala (37 percent) and Firozpur (41.4 percent) respectively. In 17.8 percent of the sampled Sub-Centres which have an ANM in position, they stay in the Sub-Centre quarter (Table 9.2). Out of sampled 595 Sub-Centres in Punjab none of the ANMs reside in the Sub-Centre quarter in Gurdaspur, Amritsar, Jalandhar, Hoshiarpur, Moga, Firozpur, Muktsar, Patiyala and SAS Nagar (Mohali) districts while more than 45 percent of sampled Sub-Centres in Faridkot and Sangrur ANMs stay in Sub-Centre quarter (Table 9.2). Out of the 334 sampled Sub-Centres in public building only 7 (2.1 percent) Sub-Centres have regular electricity and it is only in 4 of the 20 districts. In 135 (40.4 percent) of the Sub-Centres located in government buildings, there are labor 334 rooms and out of this only 87 (64.4 percent) of the labor rooms are currently in use. None have the labor room in the sampled Sub-Centres of Hoshiarpur, Rupnagar and SAS Nagar (Mohali) districts. There is toilet facility in 228 (68.3 percent) of the sampled Sub-Centres located in public buildings and 82.6 percent of Sub-Centres house in government buildings have provision for water (Table 9.3).

In order to assess the adequacy of the equipments in the sampled Sub-Centres, the Sub-Centres having 60 percent of essential equipments for RCH services are categorized as adequately equipped, otherwise inadequately equipped. A similar categorization of Sub-Centres having adequate stock of essential drugs for RCH services is followed. Distribution of adequately equipped Sub-Centres and Sub-Centres having adequate stock of essential drugs by districts are shown in Table 9.4. It is being noted that 568 (95.5 percent) of the sampled Sub-Centres in Punjab are adequately equipped and there is no district-wise variation in terms of adequacy of equipments in the sampled Sub-Centres. Only 50 (8.4 percent) of the total 595 sampled Sub-Centres have adequate stock/supply of essential drugs for RCH services, and none of the sampled Sub-Centres in Hoshiarpur, Fatehgarh Sahib, Firozpur, Muktsar and Faridkot have adequate essential drugs. Citizen's charter is displayed in 50.8 percent of the sampled 595 Sub-Centres (Table 9.5). The proportion of sampled Sub-Centres facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 82.6 and 92.3 percent respectively.

There are 79 (59 percent) PHCs where Medical Officers (MO) are serving. In all the districts of Punjab Medical Officers (MO) are available, except Kapurthala district. There is no Lady Medical Officer (LMO) in the sampled PHC from Gurdaspur, Hoshiarpur, Firozpur, Muktsar, Bathinda and Barnala. There are LMOs in position in 27 (20.2 percent) of the 134 sampled PHCs. However, none of the sampled 134 PHCs have AYUSH doctors in position and 96.3 percent of the PHC have Pharmacists.

Only 35 (26.1 percent) of the 134 sampled PHCs have residential quarters available for MO but sampled PHCs in Gurdaspur, Jalandhar, Hoshiarpur, Rupnagar and Barnala do not have such provision. Any of the sampled PHCs in eight districts is not functioning on a 24 hour basis and

17.2 percent sampled PHCs are functioning 24 hours. About 75 percent of the sampled PHCs catering to the sample villages have at least 4 beds and such facilities are available in all districts except Jalandhar and SAS Nagar (Mohali). In contrast to the condition of Sub-Centre, only 10 (7.5 percent) sampled PHCs have regular power supply and only 17 (12.7 percent) have functional vehicles (Table 9.7). New born care equipments are available in 20.9 percent of the sampled PHCs, 50 percent have functional operation theatres and 43.5 percent provide referral services for delivery (Table 9.8).

Forty percent of the 134 PHCs in Punjab have at least 60 percent of essential drugs and 53 percent have at least 60 percent of essential cold storage systems. Few of the PHCs in some districts have conducted at least 10 deliveries in the last one month, but none of the PHCs in seven districts (Gurdaspur, Hoshiarpur, Ludhiana, Faridkot, and SAS Nagar (Mohali)) had conducted at least 10 deliveries in the same reference period. Untied funds have been utilized by 111 of the 134 sampled PHCs and all sampled PHCs in Amritsar, Kapurthala, Jalandhar, Hoshiarpur, Nawanshahr, Rupnagar, Fatehgarh Sahib, Firozpur, Muktsar and SAS Nagar (Mohali) have utilized untied funds Rogi Kalyan Samitis (RKS) have been constituted in 91(67.9 percent) of the sampled 134 PHCs and Citizen's Charter displayed in 89 (66.4 percent) of sampled PHCs (Table 9.9).

The distribution of 155 sampled CHCs among the districts in Punjab is uneven with Gurdaspur having 19 of them and just 2 in Faridkot. Not a single sampled CHC in Faridkot, Tarn Taran and Barnala which cater to the RCH services of sampled villages, have a gynecologist in position. In Kapurthala, Jalandhar, Rupnagar, Fatehgarh Sahib and Ludhiana, at least 50 percent of the sampled CHCs serving the sampled villages have a gynecologist in position. The proportion of sampled CHCs which have a Pediatrician, Anesthetist and Health Manager are 17.4, 7.7 and 5.8 percent respectively (Table 9.10). In 14 districts of Punjab none of the sampled CHCs which provide RCH services to the sampled villages has blood storage facility. For the state as a whole only 5 (8.2 percent) of the sampled 155 CHCs have blood storage facility. All the sampled CHCs in Fatehgarh Sahib and SAS Nagar (Mohali) are designated FRUs and overall 39.4 percent of the sampled CHCs in Punjab are designated FRUs. Out of the 155 sampled CHCs, 107 (69.5 percent), 50 (82.0 percent) and 20 (12.9 percent) have functional operation theatres, new born care and low birth weight (LBW) management facilities (Table 9.11). Out of the sampled 155 CHCs, 92.3 percent of them have utilized funds. In 89.7 percent of sampled CHCs, RKS has been constituted and 83.5 percent of the constituted RKS are monitored regularly (Table 9.12).

TABLES

RESPONSE RATES AND DEMOGRAPHIC INDICATORS

TABLE 1.1 NUMBER OF HOUSEHOLDS, EVER-MARRIED WOMEN & UNMARRIED WOMEN INTERVIEWED

Number of households, ever-married women and unmarried women interviewed by district, Punjab, 2007-08

State/District	Number of households interviewed				Number of ever-married women interviewed				Number of unmarried women interviewed			
	Total	Rural	Urban	Response rate	Total	Rural	Urban	Response rate	Total	Rural	Urban	Response rate
Punjab	21,933	15,351	6,582	96.4	20,898	14,805	6,093	94.8	7,031	4,971	2,060	91.2
Amritsar	1,046	434	612	95.1	955	406	549	91.0	297	107	190	87.9

Punjab (15-49)	3.0	8.4	11.4	19,954
Punjab (15-44) †	3.4	8.6	12.0	17,702

Note: Total unmet need refers to unmet for limiting and spacing.

** Unweighted cases.

¹ Unmet need for spacing includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing.

² Unmet need for limiting includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and do not want any more children but are currently not using any family planning method. Total unmet need refers to unmet for limiting and spacing.

^a Literate but did not attend school, are also included.

[†] Represents figures for currently married women aged 15-44 years.

TABLE 6.16 UNMET NEED FOR FAMILY PLANNING SERVICES

Percentage of currently married women age 15-49 years by unmet need for family planning services by districts, Punjab, 2007-08

District	Unmet need for FP			Number of women**
	Spacing ¹	Limiting ²	Total	
Gurdaspur	2.3	9.5	11.8	934
Amritsar	2.1	4.3	6.4	896
