## INTRODUCTION

The 2005-06 National Family Health Survey (NFHS-3) is the third in the NFHS series of surveys. The first NFHS was conducted in 1992-93, and the second (NFHS-2) was conducted in 1998-99. All three NFHS surveys were conducted under the stewardship of the Ministry of Health and Family Welfare (MOHFW), Government of India. The MOHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-3 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation, UNICEF, UNFPA, and the Government of India. Technical assistance for NFHS-3 was provided by Macro International, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute, Pune (NARI).

The survey provides trend data on key indicators and includes information on several new topics, such as HIV/AIDS-related behaviour, attitudes toward family life education for girls and boys, use of the Integrated Child Development Services (ICDS) programme, men's involvement in maternal care, and health insurance. For the first time, NFHS-3 provides information on men and unmarried women. In addition, NFHS-3 provides estimates of HIV prevalence for India as a whole based on blood samples collected in every state in the country, including Jharkhand. Separate HIV estimates are also provided for Andhra Pradesh, Karnataka, Maharashtra, Manipur, Tamil Nadu, and Uttar Pradesh.

In Jharkhand, the survey is based on a sample of 2,483 households that is representative at the state level and within the state at the urban and rural levels. The household response rate in the state as a whole was 96 percent. Women age 15-49 were eligible for interview in all NFHS-3 sample households, while men age 15-54 were eligible for interview in a subsample of households. NFHS-3 interviewed 2,983 women age 15-49 and 996 men age 15-54 in Jharkhand to obtain information on population, health, and nutrition. The individual response rates were 94 percent among eligible women and 87 percent among eligible men.

Height and weight measurements were taken for all interviewed women and men and all children under age six years. Haemoglobin levels were measured for all interviewed women and men and all children age 6-59 months. In a subsample of households, all interviewed women and men were eligible to have their blood collected for HIV testing. Biomarkers were measured only after obtaining informed consent. The NFHS-3 fieldwork in Jharkhand was conducted by the Operations Research Group (ORG)-Centre for Social Research, New Delhi, from April to August 2006.

This report presents the key findings of the NFHS-3 survey in Jharkhand, followed by detailed tables and an appendix on sampling errors. More information about the definitions of indicators included in this report is contained in Volume I of the NFHS-3 National Report, and the questionnaires and details of the sampling procedure for NFHS-3 are contained in Volume II of the NFHS-3 National Report (available at www.nfhsindia.org).

## Household Characteristics

## Household composition

One-quarter of Jharkhand's households are in urban areas, with the remaining three-quarters in rural areas. Households are comprised of an average of more than 5 members. Eleven percent of households are headed by women.

The majority of households are headed by Hindus (73\%). Thirteen percent of household heads are Muslim and 14 percent of households are headed by individuals belonging to other religions.

Eleven percent of household heads in Jharkhand belong to the scheduled castes, 28 percent belong to scheduled tribes, and 45 percent belong to other backward classes (OBC). Only onesixth of Jharkhand's household heads do not belong to the scheduled castes, scheduled tribes, or other backward classes.

Forty percent of Jharkhand's population is under age 15; only 4 percent is age 65 and over.
Among children under 18 years of age, 7 percent have experienced the death of one or both parents. In all, 81 percent of children under 18 years of age live with both parents and 14 percent live with one parent.

## Housing characteristics

Only 28 percent of households live in a рисса house. Forty percent of households (23\% of rural households and $91 \%$ of urban households) have electricity, an increase from 24 percent at the time of NFHS-2. The majority of households in Jharkhand do not have electricity. Seventyseven percent of households have no toilet facilities, a reduction from 85 percent at the time of NFHS-2. All but 5 percent of rural households have no toilet facilities.

## Only eight percent of households have water piped into their dwelling, yard, or plot.

Fifty-seven percent of households use an improved source of drinking water ( $87 \%$ of urban households and $47 \%$ of rural households), but only 8 percent have water piped into their dwelling, yard, or plot. Practically no rural households have water piped into their dwelling, yard, or plot. Forty-five percent of households in Jharkhand get their drinking water from a tube well or borehole. More than one-fourth of households (28\%) treat their drinking water to make it potable. Among households that treat their drinking water the most common methods are straining the water through a cloth (39\%) or boiling the water (38\%). Eighty-nine percent of households use solid fuel for cooking.

## Wealth Index

The wealth index is constructed by combining information on 33 household assets and housing characteristics such as ownership of consumer items, type of dwelling, source of water, and availability of electricity into a single wealth index. The household population is divided into five equal groups of 20 percent each (quintiles) at the national level from 1 (lowest, poorest) to 5 (highest, wealthiest). Since the quintiles of the wealth index are defined at the national level, the proportion of the population of a

## Wealth Index

Percentage of households in urban and rural areas and percent distribution of households by wealth quintile
 particular state that falls in any specific quintile will vary across states.

The distribution of Jharkhand's households by wealth quintiles is quite skewed towards the lower wealth quintiles. More than half of households in Jharkhand ( $52 \%$ ) fall in the lowest wealth quintile, while only one-third of households fall in the top 3 quintiles together. The distribution of the rural population is even more skewed, with two-thirds of households falling in the lowest wealth quintile, in contrast to only 5 percent of urban households.

## EdUCATION

## Current school attendance among children

Less than two-thirds of children in Jharkhand (64\%) who are 6-17 years of age attend school. Seventy-three percent of primary-school age children (6-10 years) attend school ( $83 \%$ in urban areas and $70 \%$ in rural areas). School attendance drops from 71 percent among children age 11-14 years to only 37 percent among children age 15-17 years. Overall school attendance is 26 percent higher in urban areas as compared with rural areas. The urban-rural disparity widens with increasing age. The percentage of children age 15-17 years who attend school in urban areas of Jharkhand is 74 percent higher than the

Are there gender differentials in children's current school attendance?
Percentage of children attending school by age
 corresponding percentage for children in rural areas.

Gender disparity in school attendance is more pronounced in rural areas than in urban areas, and more pronounced with increasing age. There is no gender disparity in school attendance among children age 6-10 years in urban areas, but school attendance is much higher for boys $(76 \%)$ than for girls ( $64 \%$ ) in rural areas. There is gender disparity in favour of boys in both urban and rural areas at older ages of schooling (11-14 years and 15-17 years), although in urban areas its magnitude remains small (4-8 percentage points). In rural areas, the gender disparity in favour of boys is much larger and increases sharply with age of the child.

## Literacy and educational attainment

In NFHS-3, literate persons are those who have either completed at least standard six or 'passed' a simple literacy test conducted as part of the survey. According to this measure, only 37 percent of women and 69 percent of men age 15-49 in Jharkhand are literate.

While almost one-third of men (31\%) have completed 10 or more years of education, only 15 percent of women have attained that level of education. Fifty-nine percent of women and 27 percent of men age 15-49 have never been to school.

## Attitudes toward family life education in school

Virtually all adults in Jharkhand agree that children should be taught moral values in school. Most adults also think children should learn about the changes in their own bodies during puberty; fewer adults think children should learn about puberty-related changes in the bodies of the opposite sex.

Men and women differ somewhat on whether they think that children should be taught in school about contraception. About two-thirds of women ( $63 \%$ ) think girls should learn about contraception, though they are less likely to think contraception should be part of boys' school education ( $56 \%$ ). On the contrary, equal proportions of men ( $53 \%$ ) think that girls and boys should be taught about contraception in school.

Most men and women believe information on HIV/AIDS should be part of the school curriculum, though women are more likely to believe so. More than three-fourths of women think boys and girls should learn about HIV/AIDS, compared with 64-66 percent of men. About 60 percent of women say that both boys and girls should be taught about sex and sexual behaviour in school, but a smaller proportion of men ( $52-55 \%$ ) feel that this is an appropriate topic for school children.

## Fertility

## Age at first marriage

The median age at first marriage is 16.2 years among women age 20-49 years and 20.8 among men age 25-49. On average men marry four and a half years later than women. Sixty-three percent of women age 20-24 years got married before the legal minimum age of 18, and 47 percent of men age 25-29 years got married before the legal minimum age of 21 .

## Fertility levels

At current fertility levels, a woman in Jharkhand will have an average of 3.3 children in her lifetime. Fertility is now higher than it was seven years ago when NFHS-2 measured a total fertility rate (TFR) of 2.8. Fertility in Jharkhand is higher than in most other states of India and for the country as a whole (TFR 2.7). Fertility is, however, much lower than in Bihar (TFR 4.0), of which Jharkhand was a part till the year 2000 .

Fertility in rural areas is 3.7 children per woman, much higher than in urban areas, where the fertility rate of 2.3 children per woman is quite close to

Fertility Trends
Total fertility rate
(children per woman)
 replacement level fertility.

Fertility rates are higher among women in disadvantaged groups (3.1 among the scheduled castes, 3.8 among the scheduled tribes, and 3.3 among the other backward classes) than among women who do not belong to any of these groups (2.8). The fertility rate for Muslim women (4.2) is higher than the rate for Hindu women (3.0) by more than one child per woman.

## Total Fertility Rate by State

Children per woman

The greatest differentials in fertility are by education and wealth. At current fertility rates, women in the lowest wealth quintile will have 2.3 more children than women in the highest wealth quintile.

How does fertility vary with education and household wealth?
Total fertility rate (children per woman)

Education

Wealth Index

Note: Category with fewer than 125 unweighted woman-years of exposure is not shown.

## Teenage pregnancy

Among young women in Jharkhand, age 15-19, more than one-quarter ( $28 \%$ ) have already begun childbearing. Young women in rural areas are almost thrice as likely to be mothers as young women in urban areas. Prevalence of teenage motherhood is higher in Jharkhand than in any other state in India.

## Birth intervals

Research shows that waiting at least three years between children reduces the risk of infant mortality. About 60 percent of births in Jharkhand occur within three years of the previous birth, including 8 percent of births within 18 months and 24 percent within 24 months of the previous birth. The median interval between births in Jharkhand is 32 months.

## Fertility preferences

More than sixty percent of currently married adults ( $60 \%$ of women and $64 \%$ of men) either want no more children, are already themselves sterilized, or have a spouse who is sterilized. Among those who do want another child, a little more than half would like to wait at least two years before having their next child.

The desire for more children is strongly affected by the number of sons women already have. For example, among women with two children, those with two daughters are only half as likely to want no more children as those who already have one or two sons. Notably, however, the proportion of currently married women with two children who want no more children is higher in NFHS-3 than it was in NFHS-2, irrespective of the number of sons ( $64 \%$ in NFHS-3 and $44 \%$ in NFHS-2).

Fifty-four percent of women and 55 percent of men consider the ideal family size to be two children or less. Like many Indians, adults in Jharkhand show a preference for sons. About one in four women and men in Jharkhand want more sons than daughters, while only 2-4 percent want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

Unplanned pregnancies are relatively common. If all women were to have only the number of children they wanted, the total fertility rate in Jharkhand would reach replacement level fertility of 2.1 instead of
 the current rate of 3.3.

## Family Planning

## Knowledge of family planning methods

Knowledge of contraception is very high in Jharkhand. Female sterilization is the most widely known method, though the proportion of currently married women (92\%) and men ( $89 \%$ ) who know of it is lower than in most other states, where knowledge of female sterilization exceeds

How many women know about
family planning?
Percentage of currently married women

95 percent. Adults in Jharkhand are less likely to know about temporary contraceptive methods. The government family planning programme promotes three temporary methods: the pill, the IUD, and condoms. Of these three methods, married women are most likely to know about the pill (79\%) and married men are most likely to know about condoms ( $81 \%$ ).

While knowledge of sterilization has been high since NFHS-1, knowledge of temporary contraceptive methods has increased substantially since NFHS-2. For example, 79 percent of currently married women know about the pill, compared with 68 percent in NFHS-2.

## Contraceptive use

The contraceptive prevalence rate among currently married women is 36 percent, up from 28 percent in NFHS-2. The level of contraceptive use in Jharkhand is much lower than in the nation as a whole (56\%) and in all states other than Meghalaya, Nagaland, and Bihar.

Contraceptive use at last sex as reported by men in Jharkhand is much lower than women's reports of current contraceptive use; only 21 percent of currently married men report having used contraception the last time they had sex. However, men are

How many women use family planning?
Percentage of currently married women
 more likely than women to report use of condoms; 6 percent of men report having used a condom the last time they had sex, while 3 percent of women report themselves to be current users of condoms.

Urban women in Jharkhand are more than twice as likely as rural women to use contraception. Muslim women are less likely to use contraceptives (27\%) than Hindu women (41\%). Among all the groups of women by caste, education, and wealth, it is women from the scheduled tribes (19\%) who have the lowest contraceptive prevalence.

Contraceptive Prevalence Rate by State
Percentage of currently married women

| Current |
| :---: |
| contraceptive |
| use among |
| currently |
| married |
| women is |
| lower in |
| Jharkhand |
| than in all but |
| three other |
| states. |

In addition, women from the lowest wealth quintile and women with no education are less likely to use family planning methods than most other women.

Women in Jharkhand generally are more likely to use contraception if they already have a son. Among women with two children, for example, the percent using contraception increases from 16 percent for those with no sons to 38 percent for those with one son to 58 percent for those with two sons (full details not shown in tables).

Female sterilization, which accounted for 76 percent of contraceptive use in NFHS-2, now accounts for 66 percent of contraceptive use. The most commonly used spacing method by currently married women is the pill (used by 4\%).

About three-fourths of sterilized women underwent the operation in a government facility, usually in a government/municipal hospital, or in a Community Health Centre (CHC)/Rural Hospital/Primary Health Centre (PHC), whereas most users of pills and condoms rely on the private medical sector as the source of their method. More than three-fourths of pill users (78\%), and twothirds of condom users (68\%) used the private medical sector the last time they got their method. It should be noted that 16 percent of women who use condoms did not give a source but said they got their supply from their spouse.

According to women's reports, most pill users ( $75 \%$ ) and a substantial proportion of condom users (51\%) who could report the brand use social marketing brands. According to men's reports, 75 percent of condom users for whom the brand is known used a socially marketed brand.

The one-year discontinuation rates for temporary methods are quite high. More than half the users of pills ( $56 \%$ ) and condoms ( $60 \%$ ) discontinued use within the first year after having adopted the method.

## Informed choice

Women who know a variety of available contraceptive methods and their side effects are better equipped to make an informed decision when choosing what method to use. Only about one-fifth of modern contraceptive users were told by a health worker about the side effects of their method, and only 15 percent were told what to do if those side effects occurred. Only one-fifth of modern contraceptive users were told about alternative methods they could use.

## Men's attitudes

Most men in Jharkhand reject the idea that contraception is women's business and a man should not have to worry about it ( $89 \%$ ) and disagree with the statement that women using contraception may become promiscuous ( $84 \%$ ). However, 44 percent of men incorrectly believe that women who are breastfeeding cannot become pregnant. Two-thirds of men know that a condom, if used correctly, protects against pregnancy most of the time.

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely but are not using contraception. According to this definition, 23 percent of married women in Jharkhand have an unmet need for family planning, slightly up from 21 percent in NFHS-2. Currently, 61 percent of the demand for family planning is satisfied, up from 57 percent in NFHS-2.

## About one-quarter of currently married women have

 an unmet need for family planning.
## Infant and Child Mortality

The infant mortality rate in Jharkhand is currently estimated at 69 deaths before the age of one year per 1,000 live births. Currently, more than 1 in 15 children still die within the first year of life, and 1 in 11 die before reaching age five. Infant mortality in rural areas (73 per 1,000 births) is almost 50 percent higher than in urban areas ( 50 per 1,000 births).

In Jharkhand, male and female children experience similar levels of mortality during infancy (between birth and completion of the first year of life), although child mortality (after the first year of life and until the completion of five years) is slightly higher among girls than among boys.

Infant mortality is 99 deaths per 1,000 live births born to teenage mothers, compared with 66 deaths per 1,000 live births born to mothers age 20-29. Bearing children too close together in time is especially risky. Children born less than two years after a previous birth are at a nearly 60 percent greater risk of death than children born to mothers who waited two or three years between births, and three times greater than children born to mothers who waited four or more years between births.

Children whose mothers have no education are more than twice as likely to die before their first birthday as children whose mothers have completed at least 10 years of school. In addition, children from the scheduled tribes are at greater risk of dying than other children.

High-risk births have higher mortality rates
Deaths in the first year of life per 1,000 live births

Infant Mortality Rate by State
Deaths per 1,000 live births

The infant
mortality rate in
Jharkhand is
much higher
than the
national
average, and is
higher than in
all but three
other states.

## Perinatal Mortality

Perinatal mortality, which includes stillbirths and very early infant deaths (in the first week of life), is estimated at 58 deaths per 1,000 pregnancies that lasted 7 months or more. Perinatal mortality is 20 percent higher in rural areas ( 59 per 1,000 ) than in urban areas ( 50 per 1,000 ) (data for perinatal mortality not shown in tables).

## Maternal Health

## Antenatal care

Among mothers who gave birth in the five years preceding the survey, 57 percent received antenatal care from a health professional ( $39 \%$ from a doctor and $18 \%$ from other health personnel). Two in five mothers received no antenatal care. Eighty-four percent of urban women received antenatal care from a health professional, compared with only 50 percent of rural women. Younger women were more likely than older women to receive antenatal care, as were women with more education, women from the highest wealth quintile, and women having their first child. Scheduled-caste (48\%) and scheduled-tribe (47\%) women are less likely to receive antenatal care from a health professional than other backward class women ( $60 \%$ ) and women belonging to none of these ( $80 \%$ ).

Three or More Antenatal Care Visits by State
Percentage of last births in the past five years

| Despite |
| :---: |
| improvements in |

| for pregnant |
| mothers, only 36 |
| percent of |
| women received |
| three or more |
| antenatal care |
| visits during |
| their most recent |
| pregnancy. |

One-third of women received antenatal care during the first trimester of pregnancy, as is recommended. Another 16 percent had their first visit during the fourth or fifth month of pregnancy (data not shown in tables). Just over one-third of women (36\%) had three or more antenatal care visits for their last births in the past five years; urban women ( $67 \%$ ) were much more likely to receive three or more visits than women in rural areas (28\%).

In the seven years since NFHS-2, there has been a substantial increase in antenatal care coverage in Jharkhand. Notably, the
 proportion of ever-married women who received antenatal care for their most recent birth within the three years before the survey increased by 19 percentage points between NFHS-2 and NFHS-3, while the proportions who received three or more antenatal care visits and who had their first antenatal care visit in the first trimester of pregnancy increased by 12-15 percentage points in the same period.

For 50 percent of births, mothers received iron and folic acid supplements, but only 14 percent consumed them for the recommended 90 days or more. Two-thirds of mothers (68\%) received two or more doses of tetanus toxoid vaccine. Only 5 percent took a deworming drug during pregnancy.

When women do receive antenatal care, they do not receive most of the services needed to monitor the pregnancy. Little more than half of women who received ANC had their weight taken or had their blood pressure measured, about half had their blood tested, about half had their urine tested, and 62 percent had their abdomen examined.

An ultrasound test was performed during 9 percent of pregnancies. Among women from rural areas, with less than five years of education, and in the lowest wealth quintile, and among scheduled-tribe women, an ultrasound test was performed on 5 percent or fewer pregnancies. Pregnant women with no living sons are generally more likely to have an ultrasound test than women who have one or more sons.

## Delivery care

Four out of every five births in Jharkhand take place at home; only one in five births take place in a health facility. The percentage of births delivered in a health facility has increased only slightly, from 14 percent in NFHS-2 to 19 percent in NFHS-3 (among births in the three years prior to the survey). Institutional births are more common among urban women, women who received antenatal check-ups, lower parity women, those with 10 or more years of education, women in the highest wealth quintile, and women from other castes.

More than one-fourth of all births (28\%) took place with assistance from a health professional, and almost two-thirds (64\%) were delivered by a traditional birth attendant.

While only 12 percent of home births were assisted by health personnel, a clean blade was used to cut the cord in 91 percent of home births. However, only 33 percent of home births followed the recommendation that the baby be wiped dry immediately following birth and then wrapped without being bathed first. A disposable delivery kit (DDK) was used for only 5 percent of home births.

Are babies being delivered safely? Percentage of births in the past three years

## Institutional Delivery by State

Percentage of births in the past five years

> More than four
> in every five births in Jharkhand take place at home, and only 12 percent of home births are assisted by health personnel.

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. Only 17 percent of mothers in Jharkhand had a postnatal check-up within 2 days of birth, as is recommended; most women receive no postnatal care at all. While postnatal checks are more common among women who give birth in medical facilities, 31 percent of mothers who delivered in a medical facility did not receive a postnatal check-up. Only 8 percent of mothers who delivered at home received a postnatal check-up.

## Male involvement in maternal care

Fifty-two percent of men with a child below three years of age said that the child's mother received antenatal care. Forty-five percent of men with a child under three said they were present during at least one antenatal check-up received by the child's mother; only one-fourth were told what to do if the mother had a pregnancy complication, and 11-14 percent were told by a health or family planning worker about specific signs of pregnancy complications.

Few fathers with a child less than three years of age were provided information related to maternal care. Less than one-third were told about the importance of proper nutrition for the mother during pregnancy and 25 percent were told about the importance of delivering the baby in a health facility. Among fathers whose child was not delivered in a health facility, 55 percent were told about the importance of using a new or unused blade to cut the umbilical cord, 41 percent were told about the importance of cleanliness at the time of delivery, and only about one-fourth were told about the importance of breastfeeding the baby $(27 \%)$ and keeping the baby warm $(26 \%)$ immediately after birth.

## Child Health

## Vaccination of children

About one-third of children (34\%) in Jharkhand age 12-23 months are fully vaccinated against the six major childhood illnesses: tuberculosis, diphtheria, pertussis, tetanus, polio, and measles. Most children are at least partially vaccinated: only 4 percent have received no vaccinations at all.

Seventy-three percent of children have received a BCG vaccination, and somewhat more (79\%) have received at least the recommended three doses of polio vaccine. However, only 48 percent have been vaccinated against measles, and 40 percent of children have received all three recommended doses of DPT. The polio and DPT vaccines are given in a series. Many children receive the first dose but do not finish the series. Between the first and third dose, the

Trends in Vaccination Coverage
Percentage of children 12-23 months receiving vaccinations dropout rate for polio is 15 percent and the dropout rate for DPT is 39 percent.

In Jharkhand there has been substantial improvement in vaccination coverage since NFHS-2. Full vaccination coverage, which was only 9 percent in NFHS-2, increased to 34 percent in NFHS-3. The proportion of children who have not received any vaccines has declined substantially, from 27 percent to 4 percent. The largest improvement is seen in the coverage of three doses of polio vaccine (from $36 \%$ to $79 \%$ ), undoubtedly as a result of the Pulse Polio Campaign.

However, despite continuing attempts to eradicate polio from India, 21 percent of children in Jharkhand have not received the recommended three doses of polio vaccine.

Coverage of BCG increased sharply between NFHS-2 and NFHS-3, from 44 percent to 73 percent. Coverage of three doses of the DPT vaccine and the measles vaccine also improved dramatically. The proportion of children age 12-23 months who received three doses of the DPT vaccine nearly doubled between NFHS-2 and NFHS-3 (from $22 \%$ to $40 \%$ ), and the percentage of children who received a measles vaccination more than doubled (from $18 \%$ to 48\%).

Full Immunization Coverage by State
Percentage of children 12-23 months

# The majority 

 of children in Jharkhand do not get the recommended vaccinations for measles and threedoses of DPT.

Children in urban areas, children of educated mothers, children in wealthier households, and children not belonging to the scheduled castes or the scheduled tribes are more likely than other children to receive all vaccinations. Boys are slightly more likely than girls to be fully vaccinated ( $38 \%$ of boys, compared with $32 \%$ of girls).

## Childhood illnesses

In the two weeks before the survey, 5 percent of children under age five had symptoms of an acute respiratory infection (cough and short, rapid breathing that was chest-related and not due to a blocked or runny nose). Of these children, two-thirds were taken to a health facility or health provider and 12 percent received antibiotic drugs.

Twenty percent of children were reported to have had fever in the two weeks preceding the survey; 63 percent of these children were taken to a health facility or provider for treatment, and 4 percent received antimalarial drugs.

Overall, 13 percent of children in Jharkhand had diarrhoea in the two weeks preceding the survey. Among these children, 44 percent were taken to a health facility. Thirty-nine percent were treated with some kind of oral rehydration therapy (ORT) or increased fluids, including 17 percent each who were treated with a solution prepared from oral rehydration salt (ORS) packets and who were given gruel. ORS use in treating diarrhoea among children remains very low, even though 65 percent of mothers of young children have heard of ORS. More than one-third of children ( $38 \%$ ) with diarrhoea did not receive any type of treatment at all. Ten percent of children experiencing diarrhoea received antibiotics, which are not normally recommended for treating childhood diarrhoea.

Children should receive more fluids than usual during diarrhoeal illness, but in Jharkhand, only 10 percent received more liquids than normal. Half of children with diarrhoea received less to drink than normal, and an additional 12 percent received nothing to drink, which can increase the risk of dehydration.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age 6 years and pregnant or breastfeeding women, as well as preschool activities for children age 3-6 years. These services are provided through community-based anganwadi centres. Among the 92 percent of children under six years of age in Jharkhand who are in areas covered by an anganzadi centre, 42 percent receive services of some kind from the centre. The most common services children receive are supplementary food ( $37 \%$ of children under 6 years), vaccinations ( $27 \%$ of children under 6 years), and early childhood care or preschool ( $17 \%$ of children age 3-6 years). Fourteen percent of children receive growth monitoring services at an anganwadi centre.

## How many children receive anganwadi centre services?

Percentage of age-eligible children in areas covered by an anganwadi centre receiving services

Children age 12-35 months are more likely to be taken to an anganwadi centre than younger and older children. Children in rural areas are more likely to live in areas covered by an anganwadi centre, and are also more likely to receive services than are urban children. More than half of ageeligible children (57\%) from scheduled tribes in areas covered by an anganwadi centre receive some kind of service. Mothers with no education and mothers from poor households are more likely to take advantage of the services offered at anganwadi centres than are women of other educational and wealth levels.

## Breastfeeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Jharkhand, only 58 percent of children under 6 months of age are exclusively breastfed, as the World Health Organization (WHO) recommends. In addition, only 45 percent are put to the breast within the first day of life, including only 11 percent who started breastfeeding in the first hour of life, which means that many infants are deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. However, mothers in Jharkhand breastfeed for an average of 33 months, which is 9 months longer than the minimum of 24 months recommended by WHO for most children.

It is recommended that nothing be given to children other than breast milk in the first three days of life when the milk has not begun to flow regularly. However, two-thirds of children are given something other than breast milk during that period.

WHO offers three recommendations for infant and young child feeding (IYCF) practices for those 6-23 months old: continued breastfeeding or feeding with appropriate calcium-rich foods if not breastfed; feeding solid or semi-solid food for a minimum number of times per day according to age and breastfeeding status; and, including foods from a minimum number of food groups per day according to breastfeeding status. Less than half of children (43\%) age 623 months are fed the recommended minimum times per day and about one-quarter ( $28 \%$ ) are fed from the minimum number of food groups. Only 17 percent are fed according to all three recommended practices.

Vitamin A deficiency can cause eye damage and a higher risk of dying from measles, diarrhoea, or malaria. The Government of India recommends that children under three years of age receive vitamin A supplements every six months, starting at age 9 months. However, only 28 percent of last-born children age 12-35 months were given a vitamin A supplement in the past six months, and only half of children age 6-35 months ate vitamin A-rich foods the day or night before the interview.

Eating foods rich in iron and taking iron supplements can prevent anaemia. Only 11 percent of children age 6-35 months ate iron-rich foods in the day or night before the interview, and only 4 percent of children age 6-59 months were given iron supplements in the week before the interview.

## Children's nutritional status

Half of children in Jharkhand under age five are stunted, or too short for their age, which indicates that they have been undernourished for some time. One-third children are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness. Fifty-seven percent are underweight, which takes into account both chronic and acute undernutrition. By all three measures of nutritional status, children in Jharkhand have a worse nutritional status than children in most other states.

Trends in Children's Nutritional Status
Percentage of children under three years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Even during the first six months of life, when most babies are breastfed, 30 percent of children are underweight for their age and 40 percent are wasted. Children in rural areas are more likely to be undernourished, but even in urban areas, almost two in five children suffer from chronic undernutrition. Girls and boys are equally likely to be undernourished.

Children's nutritional status in Jharkhand has improved slightly since NFHS-2 by only one measure: height-for-age. Children under age three (the age group for which nutritional status data are available in NFHS-2) are less likely to be too short for their age today (47\% of children) than children in this age group were seven years ago ( $54 \%$ of children), which means chronic undernutrition is less widespread. However, they are much more likely to be too thin for their height, and slightly more likely to be too thin for their age, which means that undernutrition is still a major problem in Jharkhand.

## Adults' nutritional status

About two in five adults ( $43 \%$ of women and $39 \%$ of men) in Jharkhand are underweight. The nutritional status of adult women in Jharkhand is worse than in all other states except Bihar and Chhattisgarh and of adult men is worse in Jharkhand than in all other states except Rajasthan and Madhya Pradesh. In Jharkhand, only 5 percent of women and men are overweight or obese, compared with 13 percent of women and 9 percent of men in the nation as a whole. Overall, only 52 percent of women and 57 percent of men in Jharkhand are at a healthy weight for their height.

The nutritional status of women has remained virtually unchanged since NFHS2 , when 41 percent of ever-married women were found to be too thin.

How many women are at a healthy weight for their height?
Percent distribution of women

Undernutrition is particularly prevalent in rural areas and in the lower wealth quintiles. Overweight and obesity are most common in older adults, those in urban areas, the welleducated, and those in the highest wealth quintile.

Iodine deficiency, which can lead to miscarriage, goitre, and mental retardation, can be prevented by using iodized salt. Just over half of households in Jharkhand (54\%) were using sufficiently iodized salt at the time of the survey. This is slightly lower than the percentage observed during NFHS-2 (56\%). However, a nationwide ban on non-iodized salt took effect just as the NFHS-3 fieldwork was being completed, so the effects of the new law could not be determined by the survey.

## Anaemia

Anaemia is a major health problem in India, especially among women and children. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Among children between the ages of 6 and 59 months, the great majority - 70 percent-are anaemic. This includes 29 percent who are mildly anaemic, 39 percent who are moderately anaemic, and 2 percent who suffer from severe anaemia. Girls ( $73 \%$ ) are slightly more likely to have anaemia than boys ( $68 \%$ ). Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. About half of children are anaemic even if their mothers have 10 or more years of education or are in the highest wealth quintile.

Anaemia among women, men, and children

Seventy percent of women in Jharkhand have anaemia, including 50 percent with mild anaemia, 19 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for women with no education ( $74 \%$ ), women from the scheduled tribes ( $85 \%$ ), and women in the two lowest wealth quintiles (over 70\%). While the likelihood of anaemia declines with increasing education and increasing wealth quintile, prevalence is at least 45 percent among all education and wealth groups. Women who are breastfeeding (77\%) are more likely to have anaemia than women who are neither pregnant nor breastfeeding $(67 \%)$. Women who smoke are more likely to be anaemic (79\%) than women who do not smoke (68\%) (data not shown in tables).

Anaemia is less widespread among both women and children than it was seven years ago at the time of NFHS-2, having fallen by 3-4 percentage points since then in both groups.

More than one-third of men (37\%) in Jharkhand are anaemic, with men under 20 and over 39 more likely to suffer from anaemia than men in other age groups. About half of men with less than 5 years of education, scheduled-tribe men, and men belonging to the lowest wealth quintile are anaemic; prevalence of anaemia declines steadily with increasing wealth quintile.

## The prevalence of anaemia among adults in Jharkhand is higher than in almost

> all other states in India.

## HIV/AIDS

## Awareness of AIDS

Only one-third of women in Jharkhand have heard of AIDS. Even in urban areas, only 76 percent know about AIDS. More women know about AIDS now than in the late 1990s; among ever-married women interviewed in NFHS-2, 15 percent knew about AIDS, compared with 29 percent of ever-married women in NFHS-3.

Men are much more likely than women to know about AIDS. Sixty-one percent of men have heard of AIDS, including 91 percent in urban areas. Knowledge of AIDS among both women and men increases sharply with education and wealth status.

## Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, only 25 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 53 percent of men, and 29 percent of women know that having just one uninfected, faithful partner can reduce the chances of getting HIV/AIDS, compared with 56 percent of men. Even in the rural areas and among those with little education, men are more likely than women to know how HIV can be prevented.

Do people know how to prevent HIVIAIDS?
Percentage of women and men age 15-49

In Jharkhand, only 1 in 8 women and 1 in 4 men have 'comprehensive knowledge' of HIV/AIDS. This means they know that a healthylooking person can have HIV/AIDS, that HIV/AIDS cannot be transmitted through mosquito bites or by sharing food, and that condom use and having only one faithful, uninfected partner can help prevent HIV/AIDS.

## HIV-related stigma

Among adults in Jharkhand who have heard of AIDS, 9 in 10 would be willing to take care of a family member with HIV/AIDS in their home. While 83 percent of women say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching, only 75 percent of men agree with this. Fewer adults who have heard of AIDS say that they are comfortable buying fresh vegetables from a shopkeeper with HIV/AIDS (70\% of women and $61 \%$ of men). Three-fourth of adults who have heard of AIDS say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Overall, only 5 in 10 women and 4 in 10 men who have heard of AIDS express all four of these accepting attitudes toward persons with HIV/AIDS.

## HIV testing prior to NFHS-3, blood transfusions, and safe injections

Only 0.6 percent of women and 2 percent of men age 15-49 had ever been tested for HIV prior to the NFHS-3 survey. Urban residents are more likely than rural residents to have ever been tested for HIV.

In Jharkhand, a higher proportion of women (4\%) than men ( $2 \%$ ) have ever had a blood transfusion. Women are also more likely than men ( $35 \%$ of women, compared with $24 \%$ of men) to have received an injection from a health worker in the past year. Women from rural areas $(37 \%)$ are more likely to have received an injection than urban women ( $28 \%$ ). For 9 out of 10 women and men who received an injection from a health worker in the past 12 months, the last injection was 'safe', i.e., the syringe and needle was taken from a newly opened package or the needle used had been sterilized.

## HIV prevalence

In Jharkhand, blood was collected for HIV testing from eligible women and men in a subsample of households. The results of the HIV testing of blood samples collected from Jharkhand contributed to the national HIV prevalence estimate; however, no separate estimate of HIV prevalence is available for Jharkhand.

Nationally, NFHS-3 found that 0.28 percent of adults age $15-49$ are infected with HIV, including 0.35 percent in urban areas and 0.25 percent in rural areas. If the six states considered by the National AIDS Control Organization (NACO) as having high HIV prevalence are excluded, the HIV prevalence estimate for the remaining 23 states combined, including Jharkhand, is only 0.12 percent. In these 23 states combined, the prevalence among women and men age 15-49 is 0.08 and 0.16 , respectively.

## Sexual Behaviour

NFHS-3 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, and condom use. Additionally, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Age at first sexual intercourse

Fifty percent of women have had sexual intercourse by the time they are 17 years of age; fifty percent of men have had sexual intercourse by age 22. Among youth 15-24 years of age, women are much more likely than men to have ever had sex. The earlier age at sexual intercourse for women than men is a consequence of the fact that in India first sexual intercourse largely occurs within marriage and women marry at younger ages than men.

## Higher-risk sex and multiple sex partners

Higher-risk sex is here defined as sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past year, only 0.3 percent of women and 4 percent of men reported having had higher-risk sex in the past year. Even fewer respondents said they had had multiple sex partners in the past year ( $2 \%$ of men); none of the female respondents reported having multiple partners in the past year. Both women and men report an average of one sexual partner in their lifetime.

## Paid sex

Less than 1 percent of men said they had paid for sex in the past year.

## Adult Health and Health Care

## Tuberculosis

In Jharkhand, 598 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. Prevalence of medically treated tuberculosis is higher in Jharkhand than in most other states. People who cook with solid fuels such as wood, charcoal, dung cakes, straw, shrubs, grass, or agricultural crop waste are much more likely to have tuberculosis than people who use electricity or gas for cooking.

Most respondents have heard of tuberculosis ( $77 \%$ of women and $87 \%$ of men), but even among people who have heard of tuberculosis, only about one-third ( $37 \%$ of women and $30 \%$ of men) know that it can be spread through the air by coughing or sneezing. About half of women and two-thirds of men have misconceptions about how tuberculosis is spread. However, most women and men know that tuberculosis can be cured $(86 \%$ of women and $92 \%$ of men who have heard of tuberculosis). Only about 1 in 8 women and 1 in 10 men say that if a family member had tuberculosis, they would want to keep it a secret from their neighbours.

## Diabetes, asthma, and goitre

According to self reports, about two percent of women and one percent of men age 35-49 suffer from diabetes. Prevalence of diabetes increases with age and household wealth status. Prevalence of asthma is 3 times higher for women age 15-49 than for men in the same age group (1,291 per 100,000 women, compared with 407 per 100,000 men). The prevalence of goitre or other thyroid disorders is also higher for women than for men age 15-49 (858 per 100,000 women, compared with only 74 per 100,000 men).

## Tobacco and alcohol use

Over half of men ( $62 \%$ ) and 12 percent of women in Jharkhand use some form of tobacco, including 13 percent of pregnant women (data for pregnant women not shown in tables). Tobacco use is more common in rural areas ( $67 \%$ of men and $14 \%$ of women). Prevalence of tobacco use decreases steadily with increasing levels of education (data not shown in tables).

While alcohol consumption is less common than tobacco use, it does occur, and is more common among rural residents than among urban residents. Four in 10 men (39\%) and 1 in 10 women (10\%) drink alcohol.

## Source of health care

For most households in the state, the private medical sector is the main source of health care ( $71 \%$ of urban households and $76 \%$ of rural households). Wealthier households (68\%) are less likely to use the private medical sector than households in the lower quintiles of the wealth index ( $76 \%$ ). Among households that do not use government health facilities, the main reasons given for not doing so are poor quality of care (56\%) and lack of a nearby facility ( $55 \%$ ) (data not shown in tables).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 5 percent of households report that they have any kind of health insurance that covers at least one member of the household. While various types of programmes exist, the one which dominates is the Employee State Insurance Scheme (ESIS): 49 percent of households that have a member who is covered by any health insurance are covered by this scheme. Health insurance is more common in urban areas ( $13 \%$ of households) than in rural areas ( $2 \%$ of households).

## Women's Empowerment

## Employment and earnings

Fifty-eight percent of currently married women age 15-49 were employed in the last year, compared with 99 percent of currently married men in the same age group; two-fifths of these women received no payment for their work, and 13 percent were paid only in kind. Overall, only 47 percent of employed married women earn cash, compared with 87 percent of employed married men.

Among married women who work and are paid in cash, 88 percent decide how their earnings will be spent, either alone or together with their husbands. Twenty-four percent of women who work for cash earn about the same or more than their husbands.

## Decision making

Married women were asked who makes decisions on their own health care, making large household purchases, making household purchases for daily household needs, and visiting their own family or relatives. About two-thirds of currently married women (60-66\%) participate in making each of these decisions. However, only 42 percent of currently married women participate in making all four of these decisions and 20 percent do not participate in
making any of the four decisions. Women in nuclear households and women who are employed for cash are more likely to participate in these household decisions. The percent of women who participate in all four decisions increases steadily with age.

## Other indicators of women's empowerment

Sixty percent of women have some money that they can decide how to use. The proportion of women with money which they control is highest for women in the highest wealth quintile and women with at least 10 years of education. Only 14 percent of women have a bank or savings account that they themselves use.

Women's knowledge and use of microcredit programmes is fairly limited. Only 26 percent of women have heard of any microcredit programme in the area and only 2 percent have ever used one.

Only 51 percent of women are allowed to go by themselves to the market, only 47 percent are allowed to go by themselves to a health facility, and only 40 percent are allowed to go by themselves to places outside their own village or community (data not shown in tables). Overall, 37 percent of women are allowed to go alone to all three of these places. Older women, scheduled-tribe women, women in nuclear households, and those with 10 or more years of education have more freedom of movement than other women.

## Gender-role attitudes

Half of women in Jharkhand believe it is justifiable for a husband to beat his wife under some specific circumstances. Women are most likely to say wife beating is justified if a woman shows disrespect for her in-laws ( $32 \%$ ), or if she neglects the house or children or she argues with him (each $30 \%$ ). Men are less likely than women to agree; 33 percent of men say wife beating is justified in some specific circumstances, including 19 percent of men who believe arguing with her husband is justification for wife beating. Even among women and men who have completed at least 10 years of schooling, one in five agree that a husband is justified in beating his wife for one or more specified reasons.

More than 8 in 10 women and men agree that a woman is justified in refusing to have sex with her husband for each of the following reasons: if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, or if she is tired or not in the mood.

## Domestic Violence

Among women age 15-49, 33 percent have ever experienced physical violence, and 11 percent have ever experienced sexual violence. In all, 35 percent of women in Jharkhand have experienced physical or sexual violence, including 39 percent of ever-married women.

## Spousal violence

One in three ever-married women report having ever been slapped by their husband. Seventeen percent of ever-married women report having had their arm twisted or hair pulled by their husband; 14 percent report having been pushed, shaken, or had something thrown at them. Thirteen percent of women report a husband had punched them with his fist or with something that could hurt them. Twelve percent report that their husbands have physically forced them to have sex. Overall, 37 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or if currently not married, their most recent husband. Eighteen percent report having ever experienced spousal emotional violence. One percent of ever-married women report having ever initiated violence against their husband.

## Spousal Physical or Sexual Violence by State

Percentage of ever-married women

> More than one-
> third of evermarried women in Jharkhand have experienced spousal physical or sexual violence.

Women whose mothers were beaten by their fathers are much more likely to be in abusive marriages themselves: 62 percent of women whose mothers experienced spousal violence have themselves experienced spousal violence (physical or sexual), compared with 33 percent of women whose mothers did not experience spousal violence. Women whose husbands consume alcohol and get drunk often are much more likely than women whose husbands do not consume any alcohol to experience spousal violence; however, 25 percent of women whose husbands do not drink alcohol have also experienced physical or sexual spousal violence.

Forty-one percent of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. For most women who have ever experienced spousal violence, the violence first occurred within the first two years of their marriage (data not shown in tables).

## Help seeking behaviour

Only one in three women who have ever experienced violence have sought help to end the violence. Fifty-six percent of women have neither sought help nor told anyone about the violence. Among women who experienced only sexual violence, only 10 percent have sought help.

Abused women most often seek help from their families, either their own or their husband's family. Very few women seek help from any institutional source, such as the police or social service organizations.

| $15-19$ | 0.072 | 0.139 | 0.122 |  | 0.071 | 0.100 | 0.094 |  |
| $20-24$ | 0.188 | 0.235 | 0.222 |  | 0.201 | 0.189 | 0.191 |  |
| $25-29$ | 0.142 | 0.173 | 0.165 |  | 0.187 | 0.152 | 0.158 |  |
| $30-34$ | 0.038 | 0.100 | 0.084 |  | 0.123 | 0.070 | 0.080 |  |
| $35-39$ | 0.024 | 0.045 | 0.040 |  | 0.009 | 0.028 | 0.024 |  |
| $40-44$ | 0.000 | 0.018 | 0.012 |  | 0.000 | 0.005 | 0.004 |  |
| $45-49$ | $(0.000)$ | $(0.028)$ | 0.017 |  | 0.000 | 0.000 | 0.000 |  |
|  |  |  |  |  |  |  |  |  |
| TFR 15-44 | 2.32 | 3.55 | 3.23 |  | 2.95 | 2.72 | 2.76 |  |
| TFR 15-49 | 2.32 | 3.69 | 3.31 |  | 2.95 | 2.72 | 2.76 |  |
| CBR | 21.0 | 28.8 | 26.8 |  | 24.3 | 23.5 | 23.7 |  |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1996-98 for NFHS-2 and 2003-05 for NFHS-3). Age-specific fertility rates are expressed per woman.
Rates for the age group 45-49 might be slightly biased due to truncation.
TFR = Total fertility rate, expressed per woman
$C B R=$ Crude birth rate, expressed per 1,000 population
( ) Based on 125-249 unweighted woman-years of exposure.

## Table 12 Fertility by background characteristics

Total fertility rates for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rates, by background characteristics, Jharkhand, 2005-06

|  | $\begin{array}{c}\text { Mean number of } \\ \text { children ever }\end{array}$ |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Bercentage |  |  |  |  | \(\left.\begin{array}{c}Total <br>

manted\end{array}\right)\)

Note: Total includes cases with missing information on education, religion, and caste/tribe, which are not shown separately.
( ) Based on 125-249 unweighted woman-years of exposure for the fertility rates and 25-49 unweighted cases for the mean number of children ever born.

* Not shown; based on fewer than 125 unweighted woman-years of exposure for the fertility rates and fewer than 25 unweighted cases for the mean number of children ever born.

## Table 13 Teenage pregnancy and motherhood

Percentage of women age 15-19 who have had a live birth or who are pregnant with their first child, and percentage who have begun childbearing, by background characteristics, Jharkhand, 2005-06

| Background characteristic | Percentage who: |  | Percentage who have begun childbearing | Number of women |
| :---: | :---: | :---: | :---: | :---: |
|  | Have had a live birth | Are pregnant with first child |  |  |
| Age |  |  |  |  |
| 15 | 1.6 | 4.9 | 6.5 | 121 |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.
$\mathrm{CHC}=$ Community health centre; $\mathrm{PHC}=$ Primary health centre; $\mathrm{ANM}=$ Auxiliary nurse midwife; $\mathrm{NGO}=$ Nongovernmental organization
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes users of male sterilization, IUD, and injectables, who are not shown separately.

## Table 25 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were informed about other methods they could use, by method and initial source of method, Jharkhand, 2005-06

| Method/source | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| Method |  |  |  |  |
| Female sterilization ${ }^{1}$ | 16.8 | 12.7 | 12.8 | 172 |
| Pill | 25.7 | 17.7 | 37.8 | 68 |
| Initial source of method ${ }^{2}$ |  |  |  |  |
| Public medical sector | 18.1 | 13.3 | 15.8 | 112 |
| Private medical sector | 23.1 | 18.2 | 23.8 | 132 |
| Total | 20.6 | 15.4 | 19.9 | 252 |

Note: Table excludes users who obtained their method from friends/relatives. Total includes IUD users and women who reported the initial source of the method as nongovernmental organization or other sources, who are not shown separately.
${ }^{1}$ Among women who were sterilized in the five years preceding the survey.
${ }^{2}$ Source at start of current episode of use.

## Table 26 First-year contraceptive discontinuation rates

Percentage of contraceptive users who discontinued use of a method within 12 months after beginning its use, by reason for discontinuation and percentage who switched to another method, by type of method, Jharkhand, 2005-06

| Method | Method failure | Desire to become pregnant | Side effects/ health concerns | Costs too much | Infrequent sex/ husband away | Other reason | Total | Switched to another method ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Female sterilization | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Pill | 3.3 | 8.7 | 22.8 | 1.3 | 6.1 | 14.1 | 56.3 | 8.1 |
| Condom/Nirodh | 2.8 | 18.0 | 4.4 | 0.0 | 3.3 | 31.8 | 60.4 | 8.1 |
| All modern spacing methods ${ }^{2}$ | 2.8 | 11.8 | 15.5 | 0.7 | 4.5 | 20.0 | 55.4 | 8.1 |
| All spacing methods ${ }^{3}$ | 2.5 | 12.6 | 10.3 | 0.5 | 4.9 | 21.5 | 52.2 | 6.9 |
| All methods | 1.9 | 9.5 | 7.8 | 0.4 | 3.8 | 16.2 | 39.5 | 5.2 |

## Note: Table is based on episodes of contraceptive use that began 3-59 months prior to the survey.

${ }^{1}$ Used a different method in the month following discontinuation or said they wanted a more effective method and started another method within two months of discontinuation.
${ }^{2}$ Includes injectables and other modern spacing methods that are not shown separately.
${ }^{3}$ Includes IUD, injectables, and other spacing methods that are not shown separately.

| Table 27 Men's contraception-related perceptions and knowledge |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Percentage of men age 15-49 who agree with two specific statements about women and contraception and say that a woman who is breastfeeding cannot become pregnant, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Jharkhand, 2005-06 |  |  |  |  |  |  |  |  |  |
| Percentage of men who agree |  |  |  |  |  |  |  |  |  |
| Background characteristic | Contraception is women's business and a man should not have to worry about it | Women who use contraception may become promiscuous | A woman who is breastfeeding cannot become pregnant | Percentage of men who say that if a male condom is used correctly, it protects against pregnancy: |  |  |  |  | Number of men |
|  |  |  |  | Most of the time | Sometimes | Not at all | Don't know/unsure ${ }^{1}$ | Total |  |

Note: Total includes women with missing information on education, religion, and caste/tribe, who are not shown separately.
${ }^{1}$ Unmet need for spacing includes pregnant women whose pregnancy was mistimed; amenorrhoeic women who are not using family planning and whose last birth was mistimed, or whose last birth was unwanted but now say they want more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and say they want to wait 2 or more years for their next birth. Also included in unmet need for spacing are fecund women who are not using any method of family planning and say they are unsure whether they want another child or who want another child but are unsure when to have the birth.
Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; amenorrhoeic women who are not using family planning, whose last child was unwanted, and who do not want any more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant and amenorrhoeic women who became pregnant while using a method (these women are in need of a better method of contraception).
${ }^{2}$ Using for spacing is defined as women who are using some method of family planning and say they want to have another child or are undecided whether to have another. Using for limiting is defined as women who are using and who want no more children. Note that the specific methods used are not taken into account here.
${ }^{3}$ Nonusers who are pregnant or amenorrhoeic whose pregnancy was the result of a contraceptive failure are not included in the category of unmet need, but are included in total demand for contraception (since they would have been using had their method not failed).

## Table 29 Age at first marriage

Percentage of women and men age 15-49 who were first married by specific exact ages, percentage never married, and median age at first marriage, first cohabitation with spouse, and first sex according to current age, Jharkhand, 2005-06

| Multiple high-risk category |  |  |  |
| Mother's age $<18$ and birth interval $<24$ months $^{2}$ | 1.6 | * | 0.4 |
| Mother's age >34 and birth interval <24 months | 0.0 | nc | 0.1 |
| Mother's age >34 and birth order > $>3$ | 3.5 | 1.1 | 13.2 |
| Mother's age $>34$ and birth interval $<24$ months and birth order > 3 | 0.8 | * | 1.1 |
| Birth interval <24 months and birth order > 3 | 6.7 | 2.7 | 6.8 |
| Subtotal | 12.6 | 2.2 | 21.6 |
| In any avoidable high-risk category | 55.3 | 1.9 | 52.1 |
| Total | 100.0 | na | 100.0 |
| Number of births | 1,741 | na | 2,336 |

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.
na $=$ Not applicable
$\mathrm{nc}=$ Not calculated because there are no cases

* Ratio not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher.
${ }^{2}$ Includes the category age $<18$ and birth order $>3$.
${ }^{\mathrm{a}}$ Includes sterilized women.

| Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth, according to background characteristics, Jharkhand, 2005-06 |  |  |  |  |  |  |  |  |  |

| Total | 9.3 | 2,183 | 40.3 | 41.4 | 10.5 | 7.7 | 100.0 | 204 |

Note: Total includes pregnancies with missing information on antenatal care visits, religion, and caste/tribe, which are not shown separately. nc $=$ Not calculated because there are no cases
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes only the most recent pregnancy in the five years preceding the survey.
${ }^{2}$ For multiple births, sex of pregnancy outcome is the sex of the first listed birth.

## Table 37 Delivery and postnatal care

Percent distribution of live births in the five years preceding the survey by place of delivery and assistance during delivery and percentage delivered by a skilled provider and by caesarean section, percentage of live births whose delivery was done at home by whether the delivery protocol was followed, and percent distribution of women giving birth in the five years preceding the survey by timing and type of provider of the first postnatal check-up of the mother following their most recent live birth, by residence, Jharkhand, 2005-06

| Delivery and postnatal care descriptors | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Place of delivery |  |  |  |
| Health facility | 53.3 | 10.3 | 18.3 |
| Public sector | 9.6 | 1.9 | 3.4 |
| NGO/trust | 2.1 | 1.7 | 1.8 |

## Table 40 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present during at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Jharkhand, 2005-06

| Antenatal/delivery care and information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 85.1 | 42.3 | 51.8 |
| Percentage of men who were present at any antenatal care visit | 77.0 | 36.2 | 45.3 |
| Percentage who were told by a health provider or health worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | 10.8 | 10.7 | 10.8 |
| Convulsion | 13.5 | 14.1 | 14.0 |
| Prolonged labour | 12.2 | 12.8 | 12.6 |
| Percentage ever told what to do if mother had any pregnancy complication | 27.0 | 25.5 | 25.8 |
| Percentage whose youngest child was delivered in a health facility | 55.4 | 11.4 | 21.1 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | 29.7 | 23.5 | 24.9 |
| The importance of proper nutrition for the mother during pregnancy | 35.1 | 30.2 | 31.3 |
| Family planning or delaying his next child | 25.7 | 24.8 | 25.0 |
| Number of men with a child age 0-35 months | 52 | 183 | 235 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: |  |  |  |
| Breastfeeding the baby immediately after birth | (27.3) | 27.3 | 27.3 |
| Keeping the baby warm immediately after birth | (30.3) | 25.8 | 26.3 |
| Cleanliness at the time of delivery | (39.4) | 41.7 | 41.4 |
| Using a new or unused blade to cut the cord | (42.4) | 56.8 | 55.0 |
| Number of men whose last child age 0-35 months was not delivered in a health facility | 23 | 162 | 185 |
| ( ) Based on 25-49 unweighted cases. |  |  |  |

| Table 41 Vaccinations by background characteristics |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Table 50 Breastfeeding status by age

Percent distribution of youngest children under three years living with the mother by breastfeeding status and percentage of all children under three years using a bottle with a nipple, according to age in months, Jharkhand, 2005-06

| Age in months | Not breastfeeding | Exclusively breastfed | Breastfeeding and consuming: |  |  |  |  | Number of youngest children under three years | Percentage using a bottle with a nipple ${ }^{1}$ | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Plain water only | Non-milk liquids/ juice | Other milk | Complementary foods | Total |  |  |  |
| $<2$ | (3.0) | (82.9) | (9.4) | (0.0) | (4.7) | (0.0) | 100.0 | 40 | (3.0) | 40 |
| 2-3 | (0.0) | (57.5) | (31.7) | (3.4) | (7.4) | (0.0) | 100.0 | 35 | (4.0) | 35 |
| 4-5 | 0.0 | 40.9 | 34.6 | 0.0 | 8.8 | 15.7 | 100.0 | 59 | 3.5 | 59 |
| 6-8 | 2.1 | 10.7 | 23.0 | 1.3 | 2.7 | 60.2 | 100.0 | 89 | 9.8 | 89 |
| 9-11 | 2.6 | 3.6 | 12.7 | 0.0 | 2.4 | 78.8 | 100.0 | 100 | 10.2 | 102 |
| 12-17 | 6.2 | 0.5 | 3.4 | 0.0 | 0.0 | 89.9 | 100.0 | 140 | 6.0 | 142 |
| 18-23 | 15.8 | 0.0 | 1.6 | 0.0 | 0.0 | 82.7 | 100.0 | 152 | 7.3 | 163 |
| 24-35 | 32.6 | 0.5 | 0.3 | 0.0 | 0.0 | 66.6 | 100.0 | 234 | 2.0 | 293 |
| <4 | 1.6 | 71.0 | 19.8 | 1.6 | 6.0 | 0.0 | 100.0 | 75 | 3.4 | 75 |
| $<6$ | 0.9 | 57.8 | 26.3 | 0.9 | 7.2 | 6.9 | 100.0 | 134 | 3.5 | 134 |
| 6-9 | 1.6 | 8.0 | 20.8 | 1.0 | 2.0 | 66.6 | 100.0 | 119 | 11.5 | 119 |
| 12-23 | 11.2 | 0.2 | 2.4 | 0.0 | 0.0 | 86.1 | 100.0 | 292 | 6.7 | 305 |

Note: Breastfeeding status refers to a '24-hour' period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water only, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children who receive breast milk and non-milk liquids and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water.
( ) Based on 25-49 unweighted cases.
${ }^{1}$ Based on all children under three years

na $=$ Not applicable

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ It is assumed that children not currently living with the mother are not currently breastfeeding. ${ }^{2}$ Either exclusively breastfed or received breast milk and plain water and/or non-milk liquids only.
${ }^{3}$ Food groups are: a. infant formula, milk other than breast milk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits ${ }^{4}$ At least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months.
${ }^{5}$ Commercially produced infant formula; tinned, powdered, or fresh animal milk; cheese; yogurt; or other milk products.
${ }^{6}$ Three or more food groups for breastfed children and four or more food groups for non-breastfed children.
${ }^{7}$ Fed solid or semi-solid food at least twice a day for infants 6-8 months, 3 or more times for other breastfed children, and 4 or more times for non-breastfed children ${ }^{8}$ Non-breastfed children age 6-23
minimum number of food groups.

## Table 52 Prevalence of anaemia in children

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Jharkhand, 2005-06, and percentage of children age 6-35 months classified as having anaemia, NFHS-3 and NFHS-2

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR3): 1-29). Haemoglobin levels shown in grams per decilitre ( $\mathrm{g} / \mathrm{dl}$ ). Total includes Sikh children, children belonging to other religions, children with missing information on birth order, mother's education, religion, caste/tribe, and mother's anaemia status, who are not shown separately.
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Excludes children whose mothers were not interviewed.
${ }^{2}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{3}$ Includes children whose mothers are deceased.

| Other | 0.3 | $(4.2)$ | 0.6 |
| Number who experienced physical violence | 604 | 38 | 642 |
| Person committing sexual violence |  |  |  |
| Current husband | 89.0 | $*$ | 84.9 |
| Former husband | 5.0 | $*$ | 4.8 |
| Current/former boyfriend | 0.7 | $*$ | 2.6 |
| Other relative | 3.4 | $*$ | 5.7 |
| In-law | 0.4 | $*$ | 0.4 |
| Own friend/acquaintance | 1.1 | $*$ | 0.4 |
| Stranger | 212 | 10 | 1.4 |
| Number who experienced sexual violence |  | 223 |  |

Note: All women were asked about their experience of physical violence since age 15. Evermarried women were also asked about their experience of spousal physical violence at any age. ( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

## Table 76 Forms of spousal violence

Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever or in the 12 months preceding the survey, Jharkhand, 2005-06

| Type of violence | Ever | In the past 12 months ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Often | Sometimes | Often or sometimes |
| Physical violence |  |  |  |  |
| Any form of physical violence | 34.7 | 3.7 | 21.1 | 24.7 |
| Pushed her, shook her, or threw something at her | 14.2 | 1.2 | 8.3 | 9.5 |
| Slapped her | 32.8 | 3.2 | 19.4 | 22.6 |
| Twisted her arm or pulled her hair | 16.8 | 1.5 | 9.5 | 11.1 |
| Punched her with his fist or with something that could hurt her | 13.4 | 1.4 | 7.6 | 9.0 |
| Kicked her, dragged her, or beat her up | 11.1 | 1.2 | 6.1 | 7.3 |
| Tried to choke her or burn her on purpose | 2.6 | 0.4 | 1.5 | 2.0 |
| Threatened her or attacked her with a knife, gun, or any other weapon | 1.2 | 0.3 | 0.8 | 1.1 |
| Sexual violence |  |  |  |  |
| Any form of sexual violence | 12.5 | 1.0 | 8.3 | 9.3 |
| Physically forced her to have sexual intercourse with him even when she did not want to | 12.2 | 1.0 | 8.1 | 9.1 |
| Forced her to perform any sexual acts she did not want to | 1.6 | 0.2 | 1.0 | 1.2 |
| Emotional violence |  |  |  |  |
| Any form of emotional violence | 18.0 | 3.1 | 11.5 | 14.6 |
| Said or did something to humiliate her in front of others | 13.5 | 2.3 | 8.5 | 10.8 |
| Threatened to hurt or harm her or someone close to her | 7.0 | 1.2 | 4.8 | 6.1 |
| Insulted her or made her feel bad about herself | 6.4 | 1.4 | 3.9 | 5.2 |
| Any form of physical and/or sexual violence | 36.9 | 4.3 | 23.3 | 27.6 |
| Any form of physical and sexual violence | 10.2 | 1.9 | 6.6 | 8.5 |
| Any form of physical and/or sexual and/or emotional violence | 40.9 | 5.8 | 25.3 | 31.1 |
| Any form of physical and sexual and emotional violence | 5.1 | 1.7 | 3.4 | 5.1 |
| Any violence by women against their husband ${ }^{2}$ | 1.2 | 0.1 | 1.0 | 1.0 |
| Number of ever-married women | 1,644 | 1,581 | 1,581 | 1,581 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.
${ }^{2}$ Any violence by women against their husband when he was not already beating or physically hurting them.

| 7 | 29.6 | 54.4 | 26.3 | 54.4 | 59.1 | 84 |
| Number of reasons given for refusing to have sexual intercourse with husband ${ }^{5}$ |  |  |  |  |  |  |
| 0 | 30.2 | 34.6 | 12.2 | 35.6 | 49.6 | 79 |
| 1-2 | 30.6 | 42.6 | 20.0 | 48.6 | 58.7 | 197 |
| 3 | 15.5 | 33.5 | 11.4 | 35.3 | 37.8 | 1,367 |
| Total | 18.0 | 34.7 | 12.5 | 36.9 | 40.9 | 1,644 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women with missing information on husband's education, husband's alcohol consumption, spousal age difference, and spousal education difference, who are not shown separately.
( ) Based on 25-49 unweighted cases.
${ }^{1}$ Currently married women only.
${ }^{2}$ Behaviours include: he is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money.
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, purchases for daily household needs, and visits to her family or relatives.
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook food properly, he suspects she is unfaithful, and she shows disrespect for in-laws.
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows husband has a sexually transmitted disease, she knows husband has sex with other women, and she is tired or not in the mood.

## Table 79 Injuries to women due to spousal violence

Percentage of ever-married women age 15-49 who have experienced specific types of spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Jharkhand, 2005-06

| Type of spousal violence experienced | Percentage of women who have had: |  |  |  |  | Number of ever-married women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Cuts, bruises, or aches | Severe burns | Eye injuries, sprains, dislocations, or burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries |  |
| Experienced physical violence |  |  |  |  |  |  |
| Ever | 42.3 | 1.4 | 10.3 | 6.7 | 44.1 | 570 |
| In the past 12 months ${ }^{1}$ | 47.0 | 1.4 | 11.7 | 7.2 | 49.2 | 391 |
| Experienced sexual violence |  |  |  |  |  |  |
| Ever | 47.1 | 1.2 | 17.3 | 11.5 | 49.7 | 204 |
| In the past 12 months $^{1}$ | 50.2 | 1.1 | 19.0 | 13.2 | 53.2 | 147 |
| Experienced physical or sexual violence |  |  |  |  |  |  |
| Ever | 39.8 | 1.3 | 9.7 | 6.3 | 41.4 | 606 |
| In the past 12 months ${ }^{1}$ | 43.5 | 1.3 | 10.8 | 6.6 | 45.6 | 436 |
| Experienced physical and sexual violence |  |  |  |  |  |  |
| Ever | 57.3 | 1.4 | 21.0 | 13.9 | 60.4 | 168 |
| In the past 12 months $^{1}$ | 66.7 | 1.6 | 25.9 | 18.3 | 70.3 | 102 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.

## Table 80 Help seeking behaviour

Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Jharkhand, 2005-06

| Source | Type of violence experienced |  |  | Marital status |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Physical only | Sexual only | Both physical and sexual | $\begin{gathered} \text { Ever } \\ \text { married } \end{gathered}$ | Never married |  |
| Help seeking behaviour |  |  |  |  |  |  |
| Never sought help and never told anyone | 60.4 | (82.9) | 39.9 | 56.8 | (50.5) | 56.4 |
| Never sought help but told someone | 4.6 | (7.6) | 17.2 | 8.4 | (3.8) | 8.1 |
| Sought help | 33.0 | (9.5) | 42.9 | 33.4 | (45.6) | 34.1 |
| Don't know/missing | 2.0 | (0.0) | 0.0 | 1.4 | (0.0) | 1.4 |
| Number of women who experienced violence | 461 | 42 | 181 | 643 | 41 | 684 |
| Sources of help among those who sought any help |  |  |  |  |  |  |
| Own family | 56.2 | * | 56.1 | 55.8 | * | 56.6 |
| Husband's family | 37.4 | * | 47.4 | 44.0 | * | 40.5 |
| Husband/last husband | 1.9 | * | 2.0 | 2.1 | * | 1.9 |
| Friend | 14.1 | * | 11.2 | 10.7 | * | 13.3 |
| Neighbour | 9.4 | * | 10.6 | 10.1 | * | 9.7 |
| Police | 0.0 | * | 1.6 | 0.6 | * | 0.5 |
| Social service organization | 0.5 | * | 0.6 | 0.6 | * | 0.5 |
| Other | 2.1 | * | 6.1 | 3.7 | * | 3.4 |
| Number of women who sought help | 152 | 4 | 78 | 215 | 19 | 234 |

[^5]
## APPENDIX

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors, and (2) sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h \quad$ represents the stratum, which varies from 1 to $H$, $m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i} \quad$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, $x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, and
$f \quad$ is the overall sampling fraction, which is so small that it is ignored.
The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-3 sample for Jharkhand, there were 95 clusters. Hence, 95 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r \quad$ is the estimate computed from the full sample of 95 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 94 clusters ( $i^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.
In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Jharkhand as a whole, and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

Table A. 1 List of variables for sampling errors, Jharkhand, 2005-06

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| No education | Proportion | De facto household population of females/males age 6 and above |
| Tuberculosis prevalence | Rate | 100,000 usual household residents |
| Using adequately iodized salt | Proportion | Households |
| Urban residence | Proportion | Women/men age 15-49 |
| No education | Proportion | Women/men age 15-49 |
| Completed 10 or more years of education | Proportion | Women/men age 15-49 |
| Never married, including married gauna not performed | Proportion | Women/men age 15-49 |
| Currently married | Proportion | Women/men age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Currently using any method | Proportion | Currently married women age 15-49 |
| Currently using a modern method | Proportion | Currently married women age 15-49 |
| Currently using a traditional method | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD | Proportion | Currently married women age 15-49 |
| Currently using condom | Proportion | Currently married women age 15-49 |
| Using public medical sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Want no more children | Proportion | Currently married women/men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women/men age 15-49 |
| Ideal number of children | Mean | Women/men age 15-49 |
| Mother received ANC from health personnel | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 90 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Births delivered by a skilled provider | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Treated with ORS packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child's vaccination card seen by interviewer | Proportion | Children age 12-23 months |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child fully vaccinated | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in last 6 months | Proportion | Children age 6-59 months |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Have heard of AIDS | Proportion | Women/men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women/men age 15-49 |
| Total and age-specific fertility rates (last 3 years) | Rate | Women |
| Mortality rates | Rate | Births in last 5 years |
| Women/men with any anaemia | Proportion | Women/men age 15-49 |
| Children with any anaemia | Proportion | Children age 6-59 months |
